

Past and Future Lessons from Neutrino Physics

Dan Dwyer (LBNL)
Feb. 11, 2014

Why Study Neutrinos?

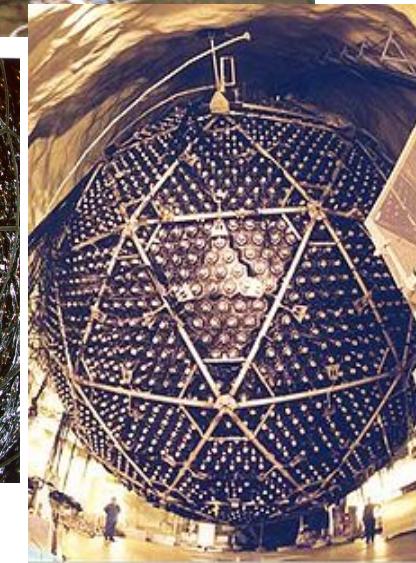

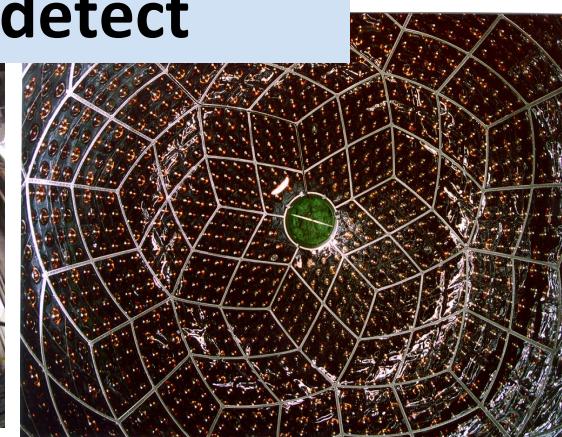

Almost non-interacting

Difficult to manage

Difficult to detect

Despite Adversity,

Significant progress in neutrino physics over the past decade.

Substantial change to Standard Model:

Lepton flavor is not conserved. Neutrinos have mass.

Neutrino Oscillation

Neutrinos change flavor (e, μ, τ) with time

Principle: Interaction (flavor) eigenstates \neq Mass eigenstates

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = U \times \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

Physical Parameters:

θ :

3 angles between mass/flavor eigenstates set **oscillation amplitude**

We want to know
 θ 's and Δm^2 's

$\theta_{12}, \theta_{23}, \theta_{13}$

Δm^2 :

Differences in 3 neutrino masses determine **oscillation frequency** (distance)

δ_{CP} : Off-diagonal phase

$$\Delta m_{21}^2 = m_2^2 - m_1^2$$

$$\Delta m_{31}^2 = m_3^2 - m_1^2$$

$$(\Delta m_{32}^2 = \Delta m_{31}^2 - \Delta m_{21}^2)$$

Oscillation Measurements

Oscillation changes neutrino flavor

Oscillation Frequency:

Neutrino oscillates according to it's proper time $\tau \approx L/E_\nu$

$$\Delta_{ji} \simeq 1.267 \frac{L[\text{m}] \Delta m_{ji}^2 [\text{eV}^2]}{E[\text{MeV}]}$$

Example:

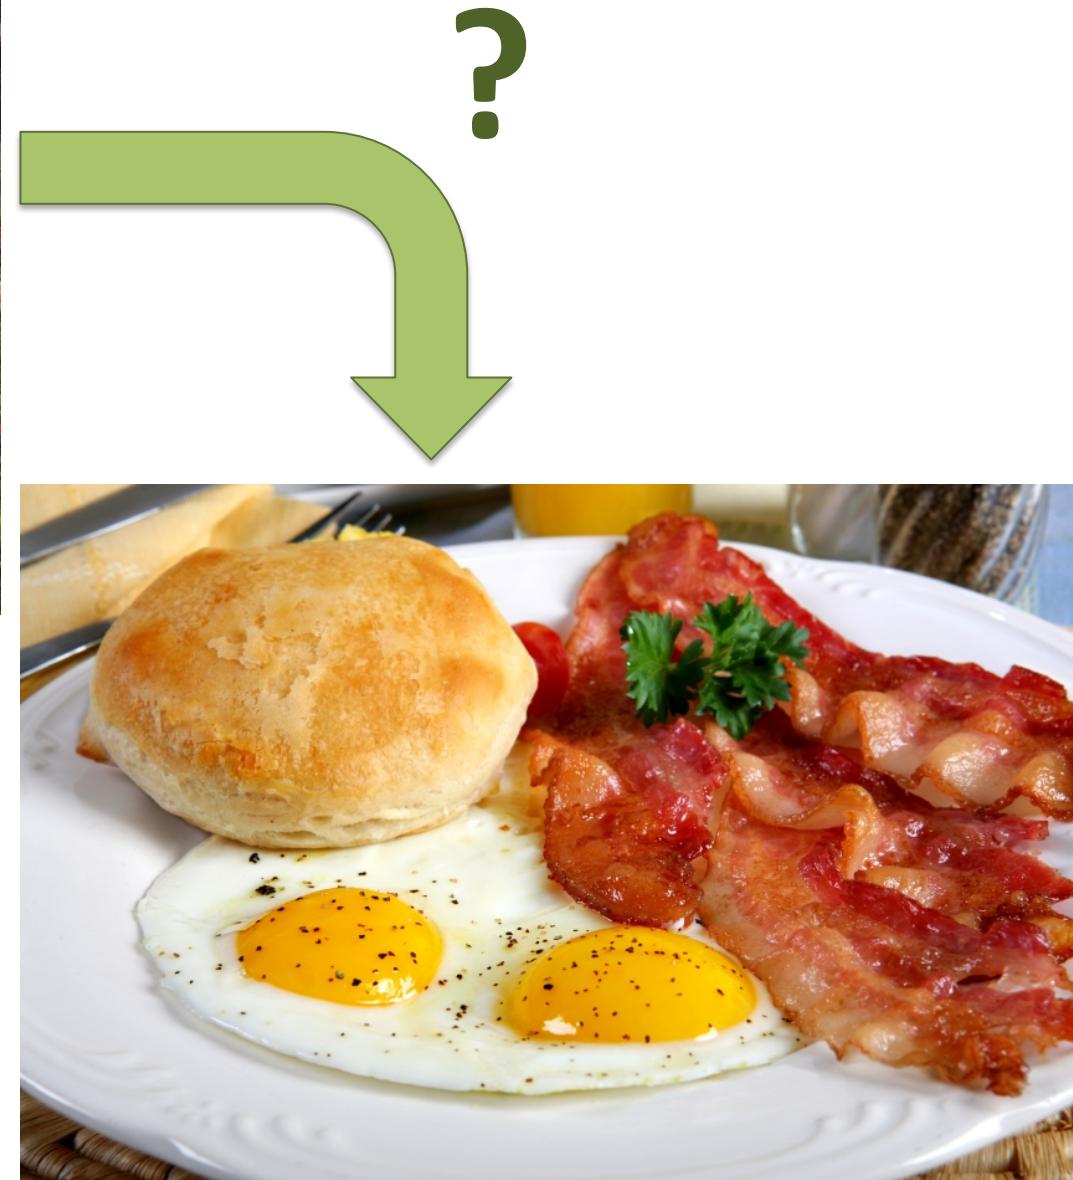

Probability to still detect as same flavor at distance L

$$P_{\bar{\nu}_e \rightarrow \bar{\nu}_e} = 1 - \cos^4 \theta_{13} \sin^2 2\theta_{12} \sin^2 \Delta_{21} \\ - \sin^2 2\theta_{13} (\cos^2 \theta_{12} \sin^2 \Delta_{31} + \sin^2 \theta_{12} \sin^2 \Delta_{32})$$

Farm-to-Table Physics

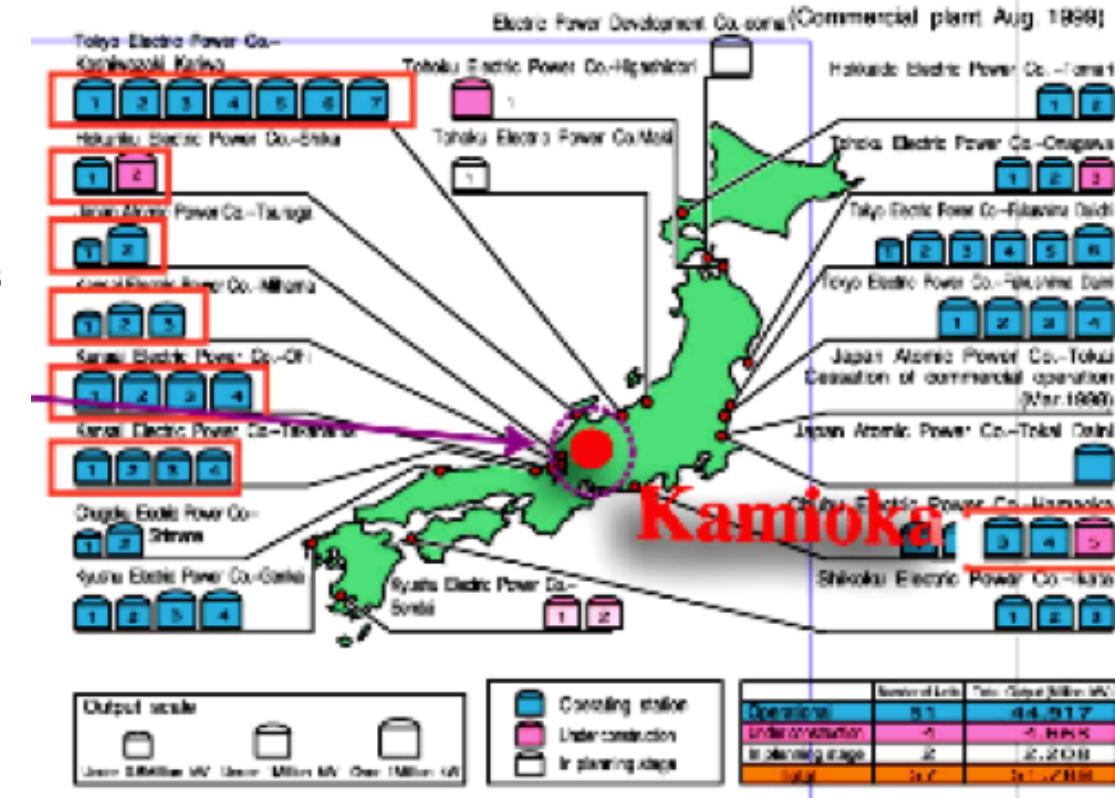

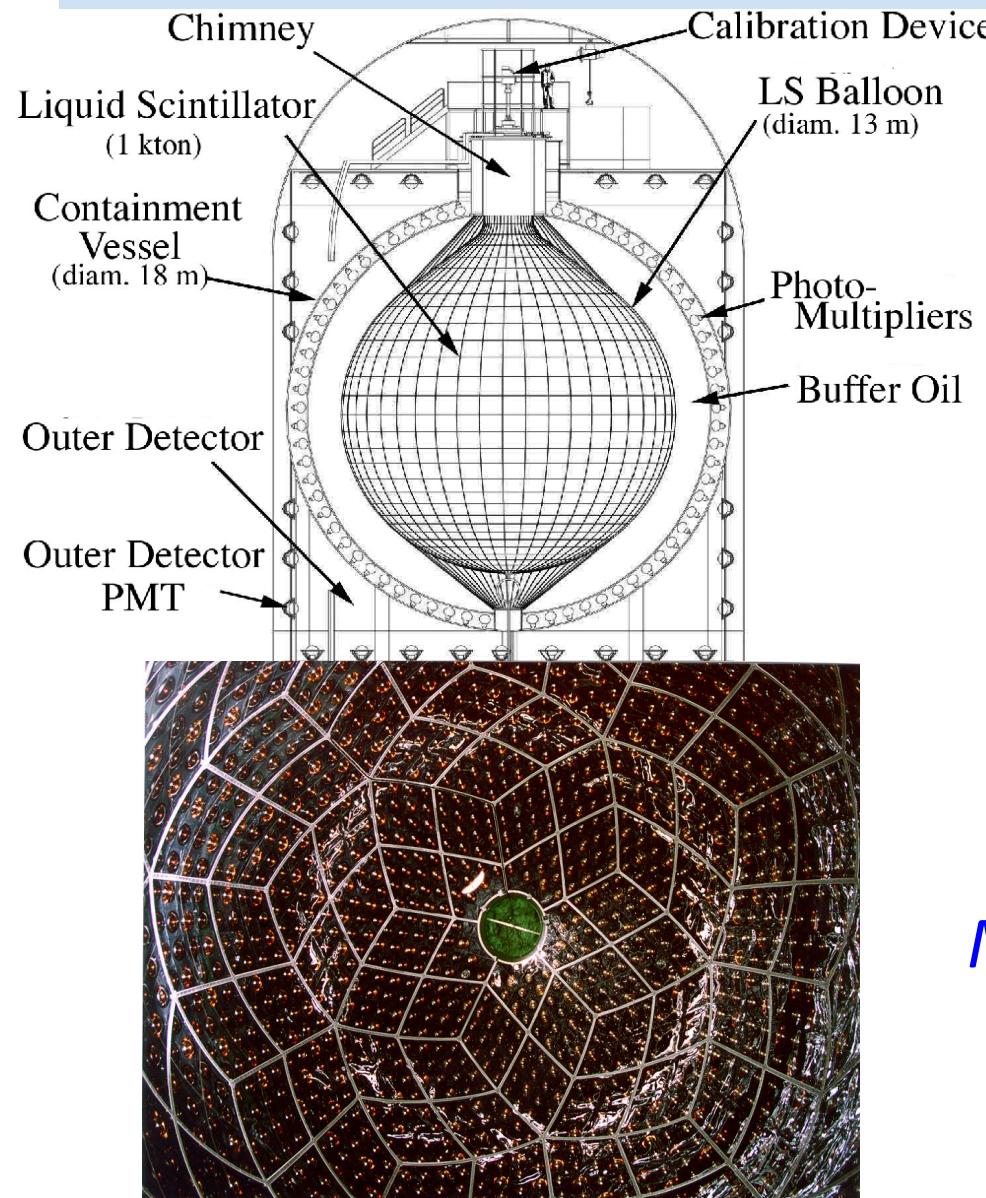

**Good experiments
require knowledge
from the ground up.**

The KamLAND Experiment

Liquid scintillator target (1 kton) measures reactor $\bar{\nu}_e$ flux

Measured roughly 1 $\bar{\nu}_e$ per day.

Understanding of backgrounds
and energy calibration essential.

Lesson

對症下藥

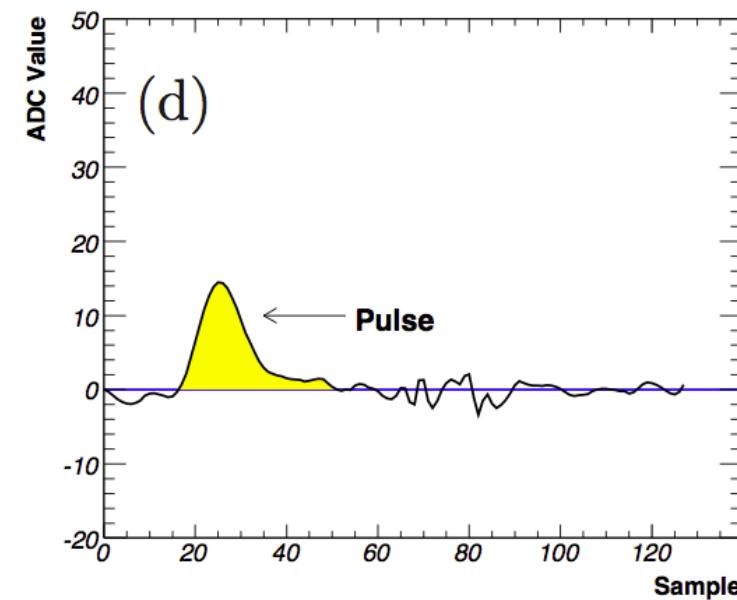

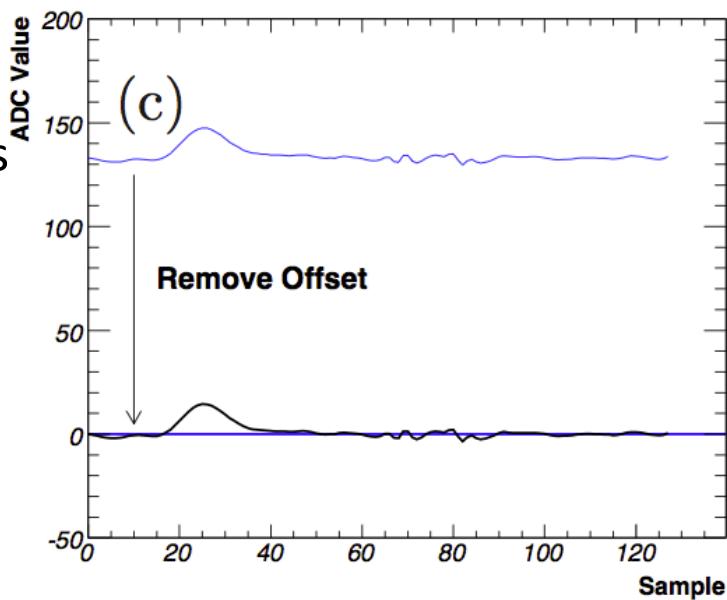

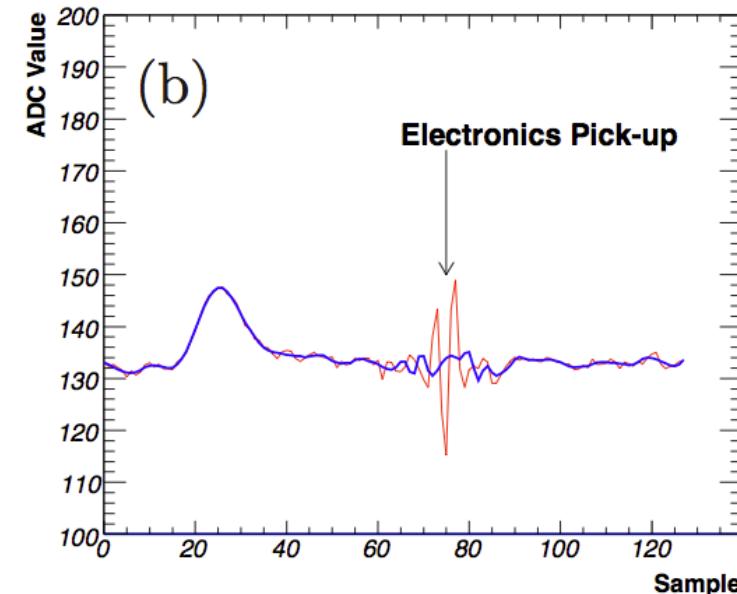

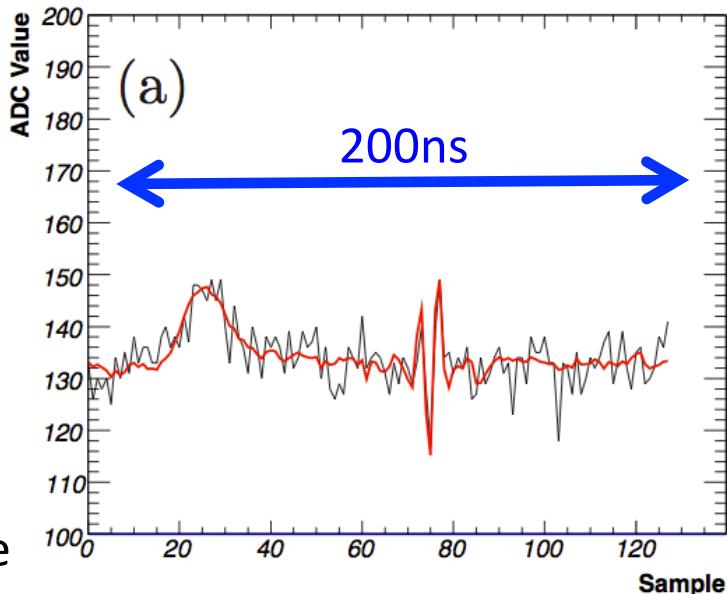

Signal Processing

ATWD:

Analog Transient
Waveform Digitizer

Provide charge-time
of photomultiplier
signal.

Developed methods
to optimally use
signal waveforms.

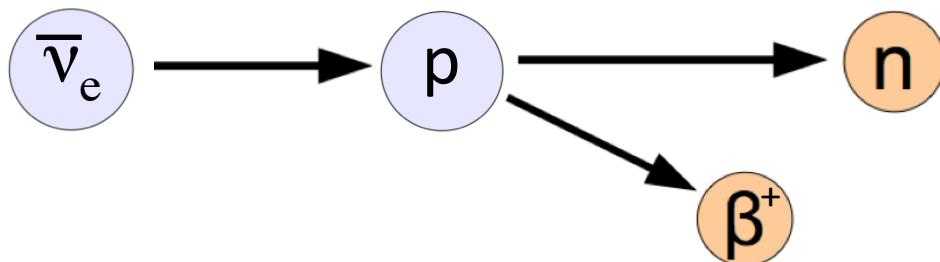

Necessary for understanding $\bar{\nu}_e$ energy and position

Cosmogenic Background

Antineutrino Signal:

Prompt: inverse β -decay positron

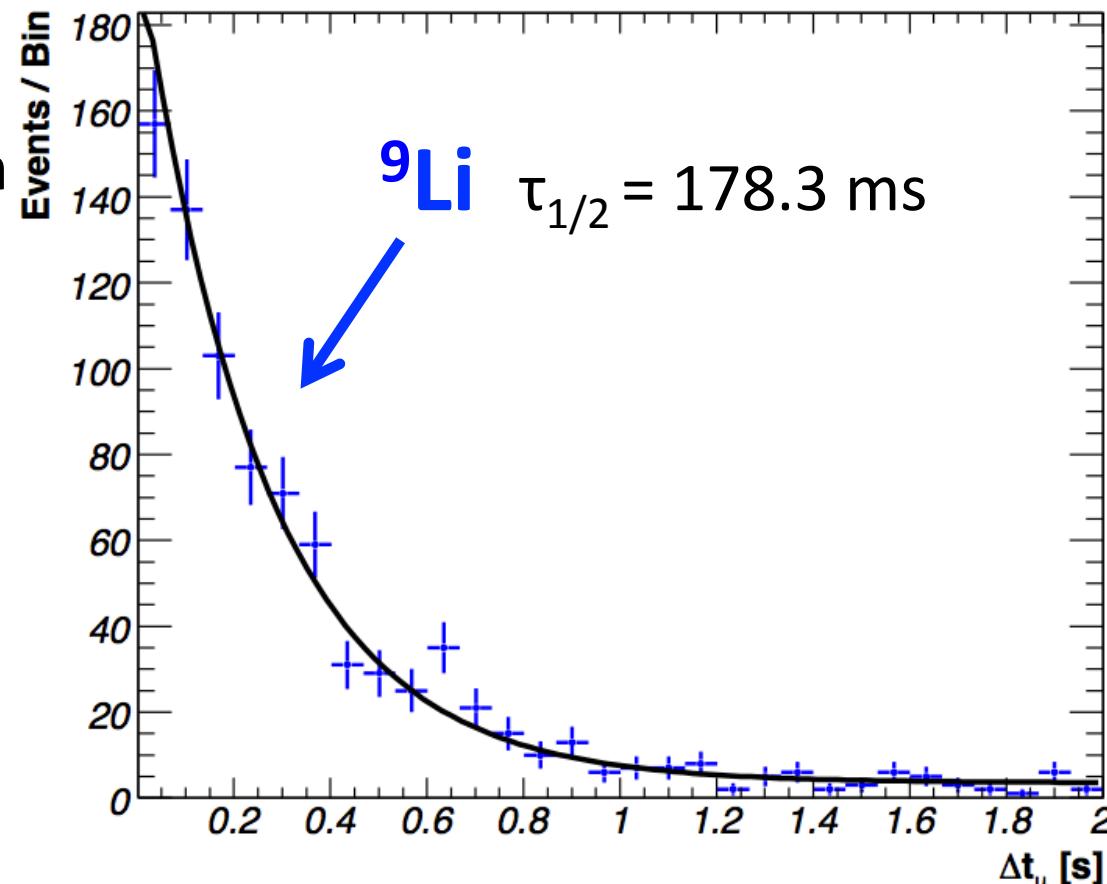

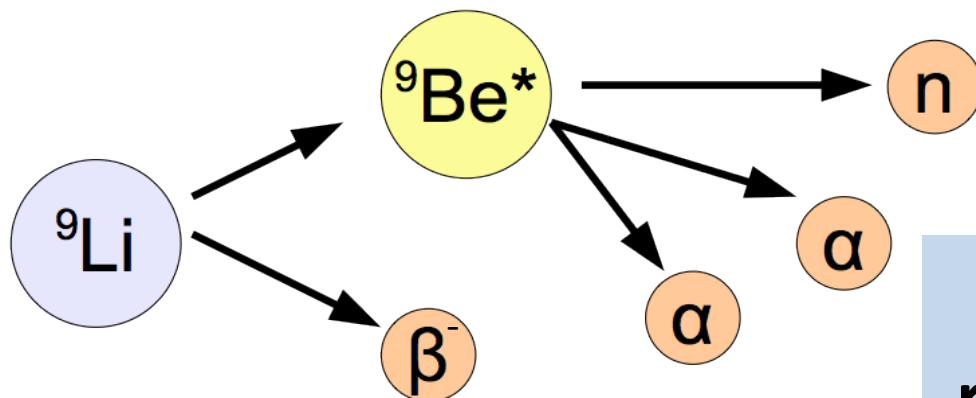

Delayed: neutron capture

Cosmogenic Background:

Prompt: β -decay electron

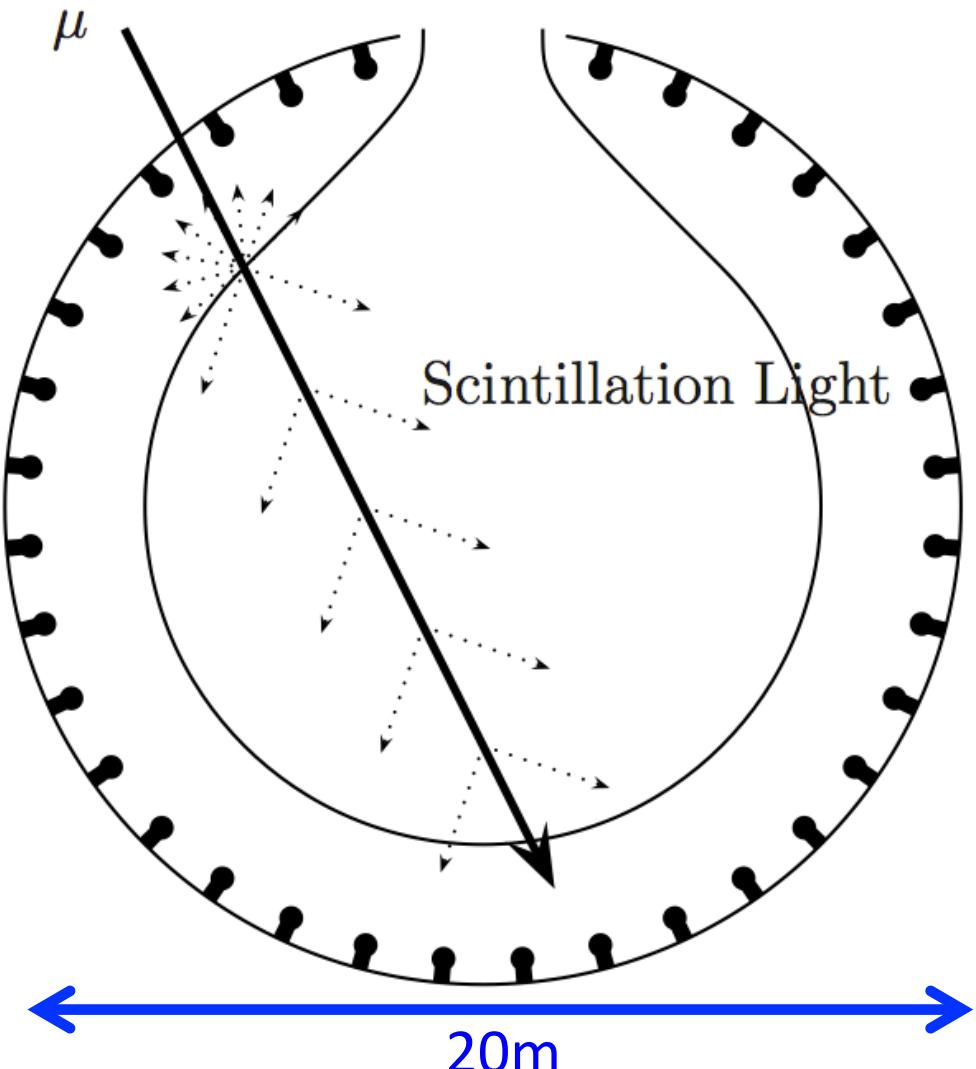

Delayed: neutron capture

Identified subset of muons
responsible for most background

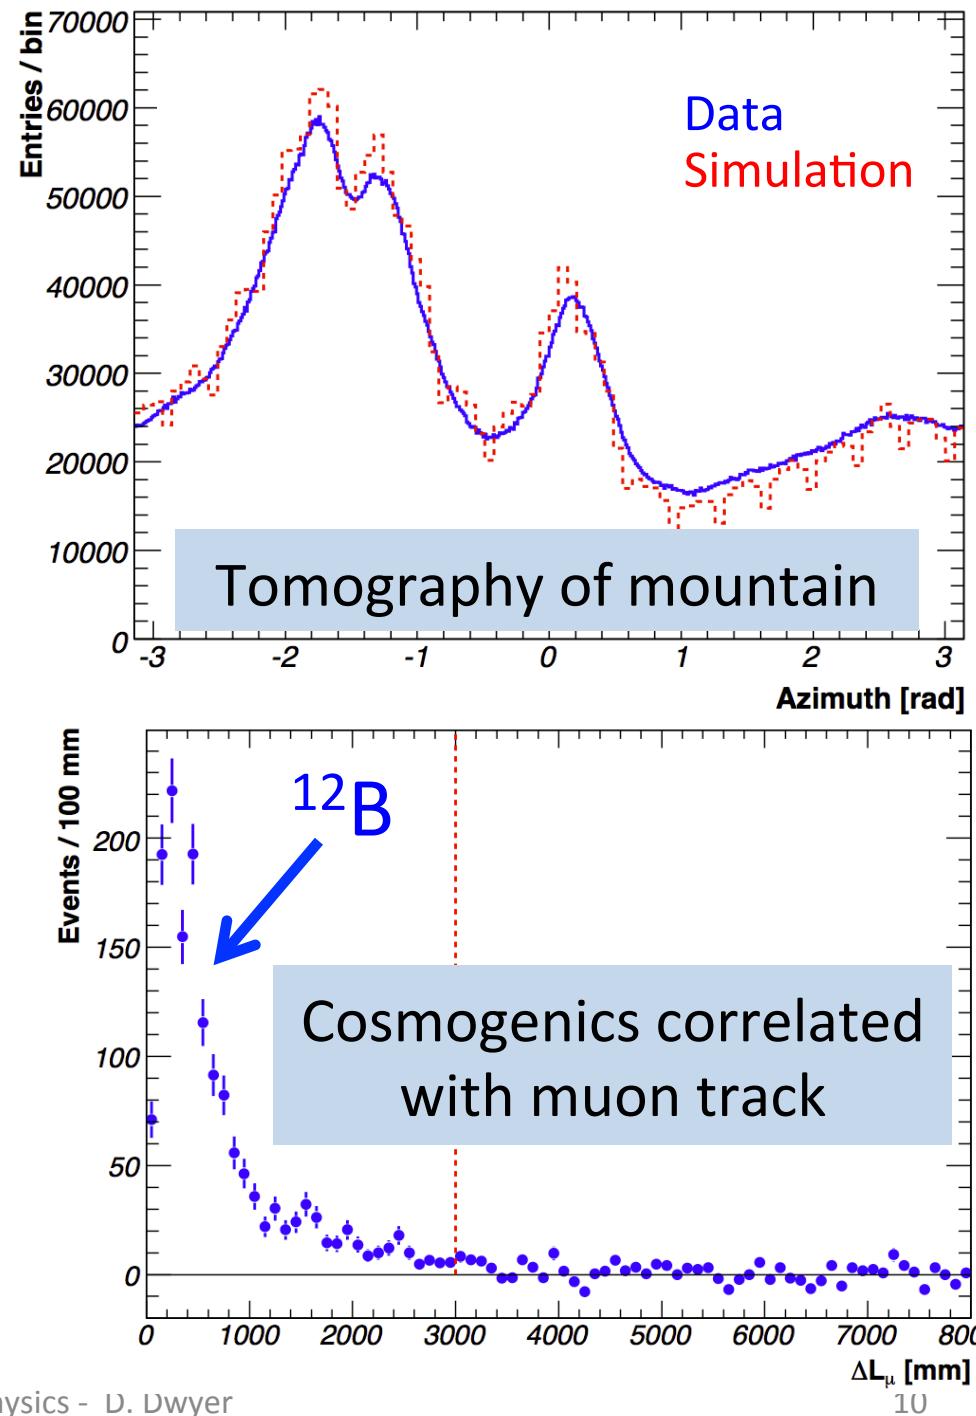

Muon Reconstruction

Developed method to determine muon track, in environment of light saturation.

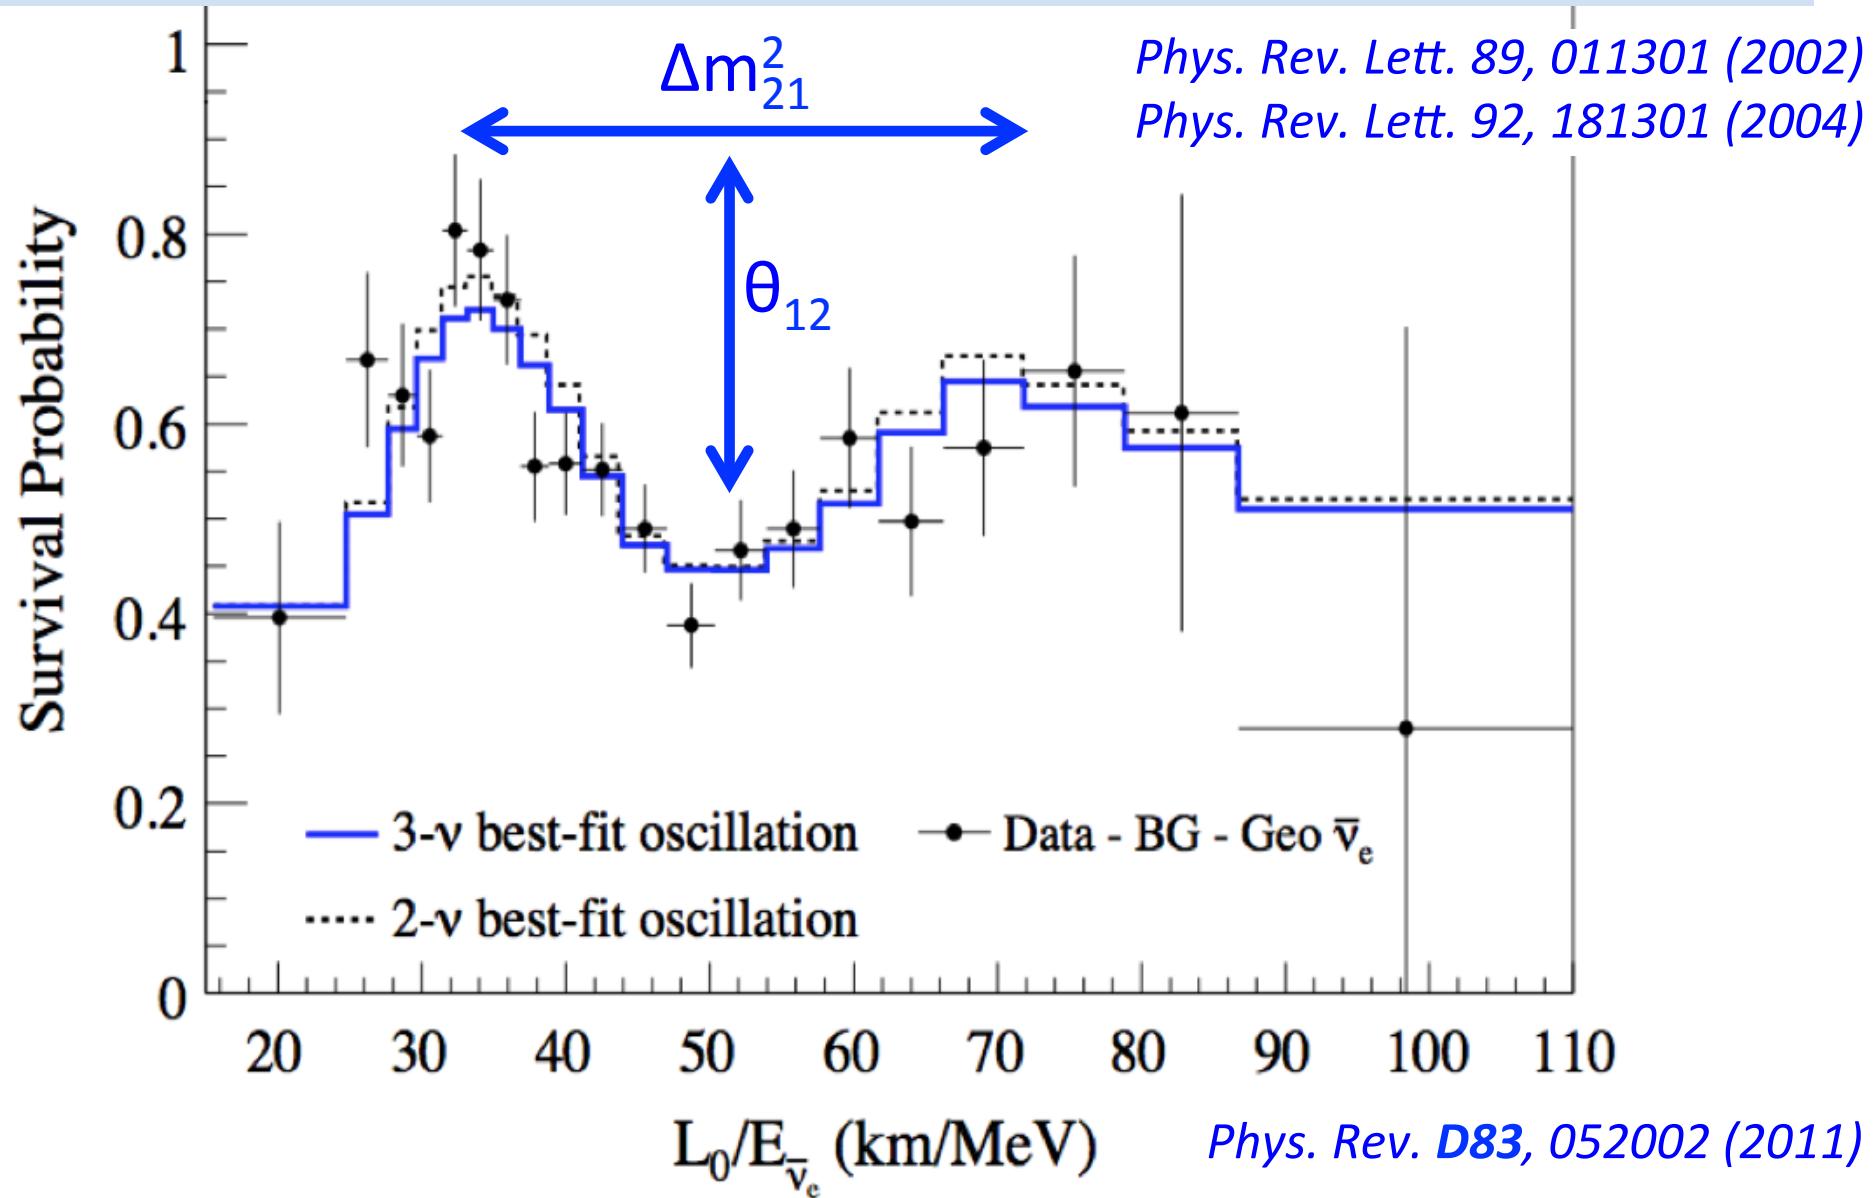

Feb. 11, 2014

Lessons From Neutrino Physics - D. Dwyer

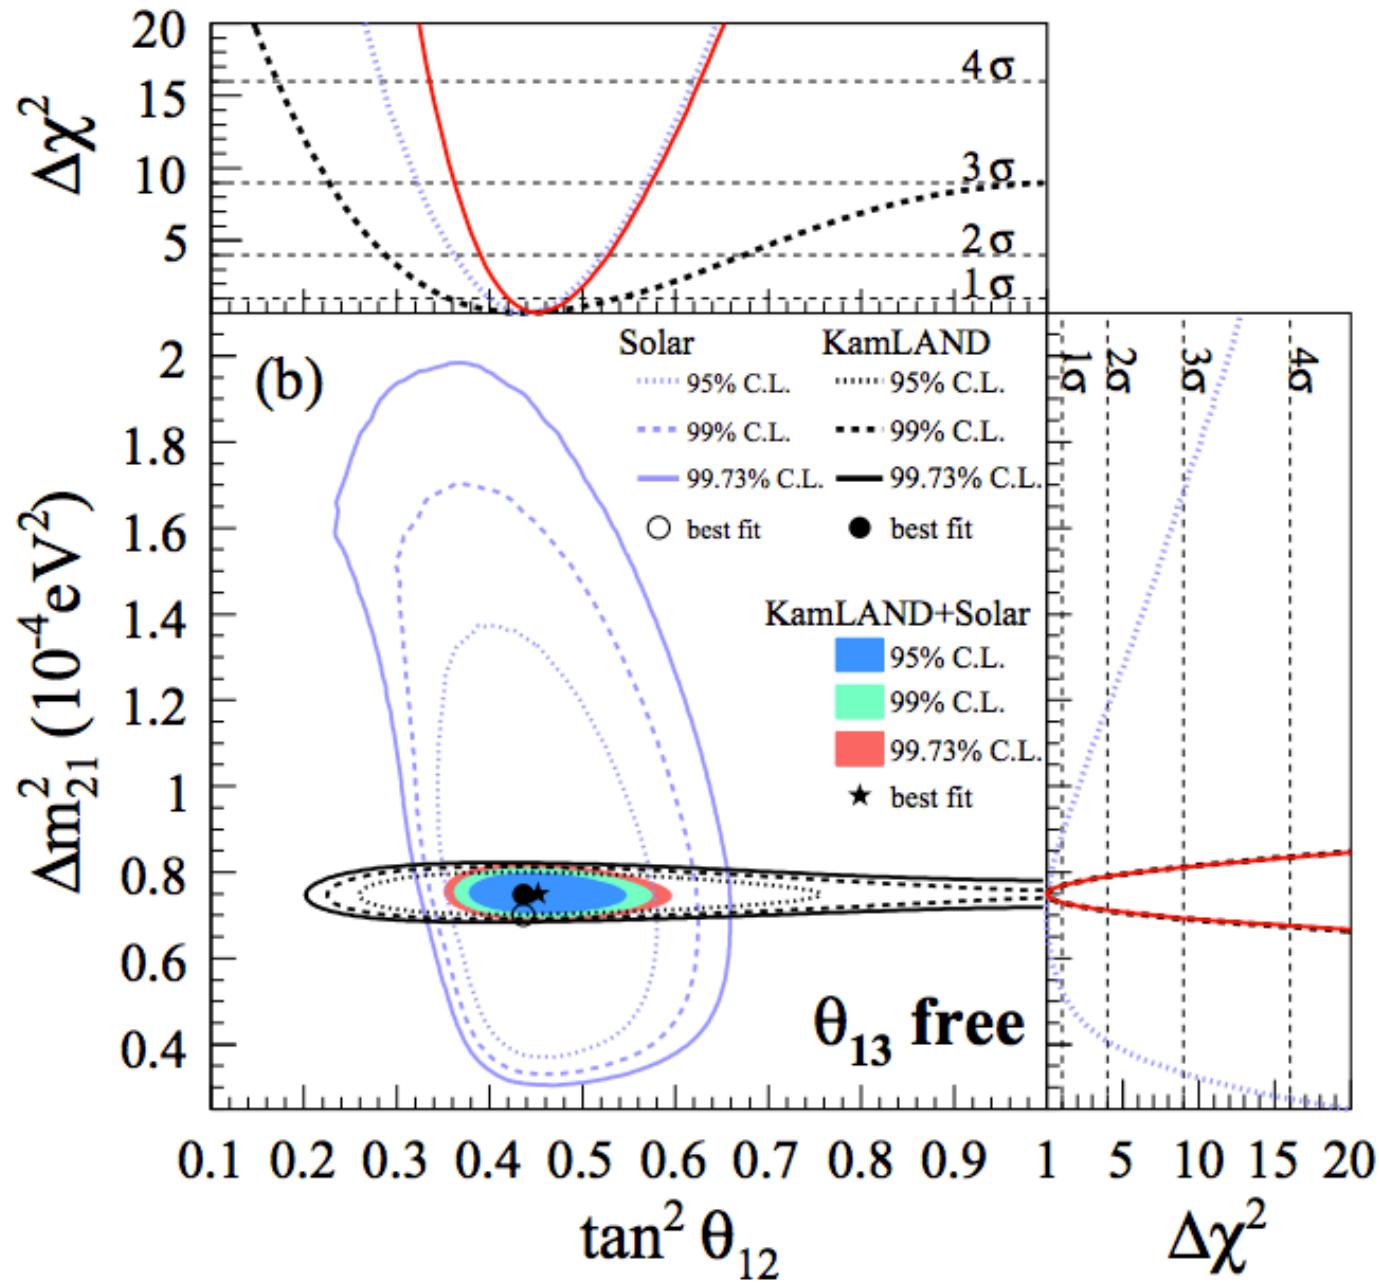

Oscillation at KamLAND

2002: KamLAND shows distinct signature of ν oscillation.

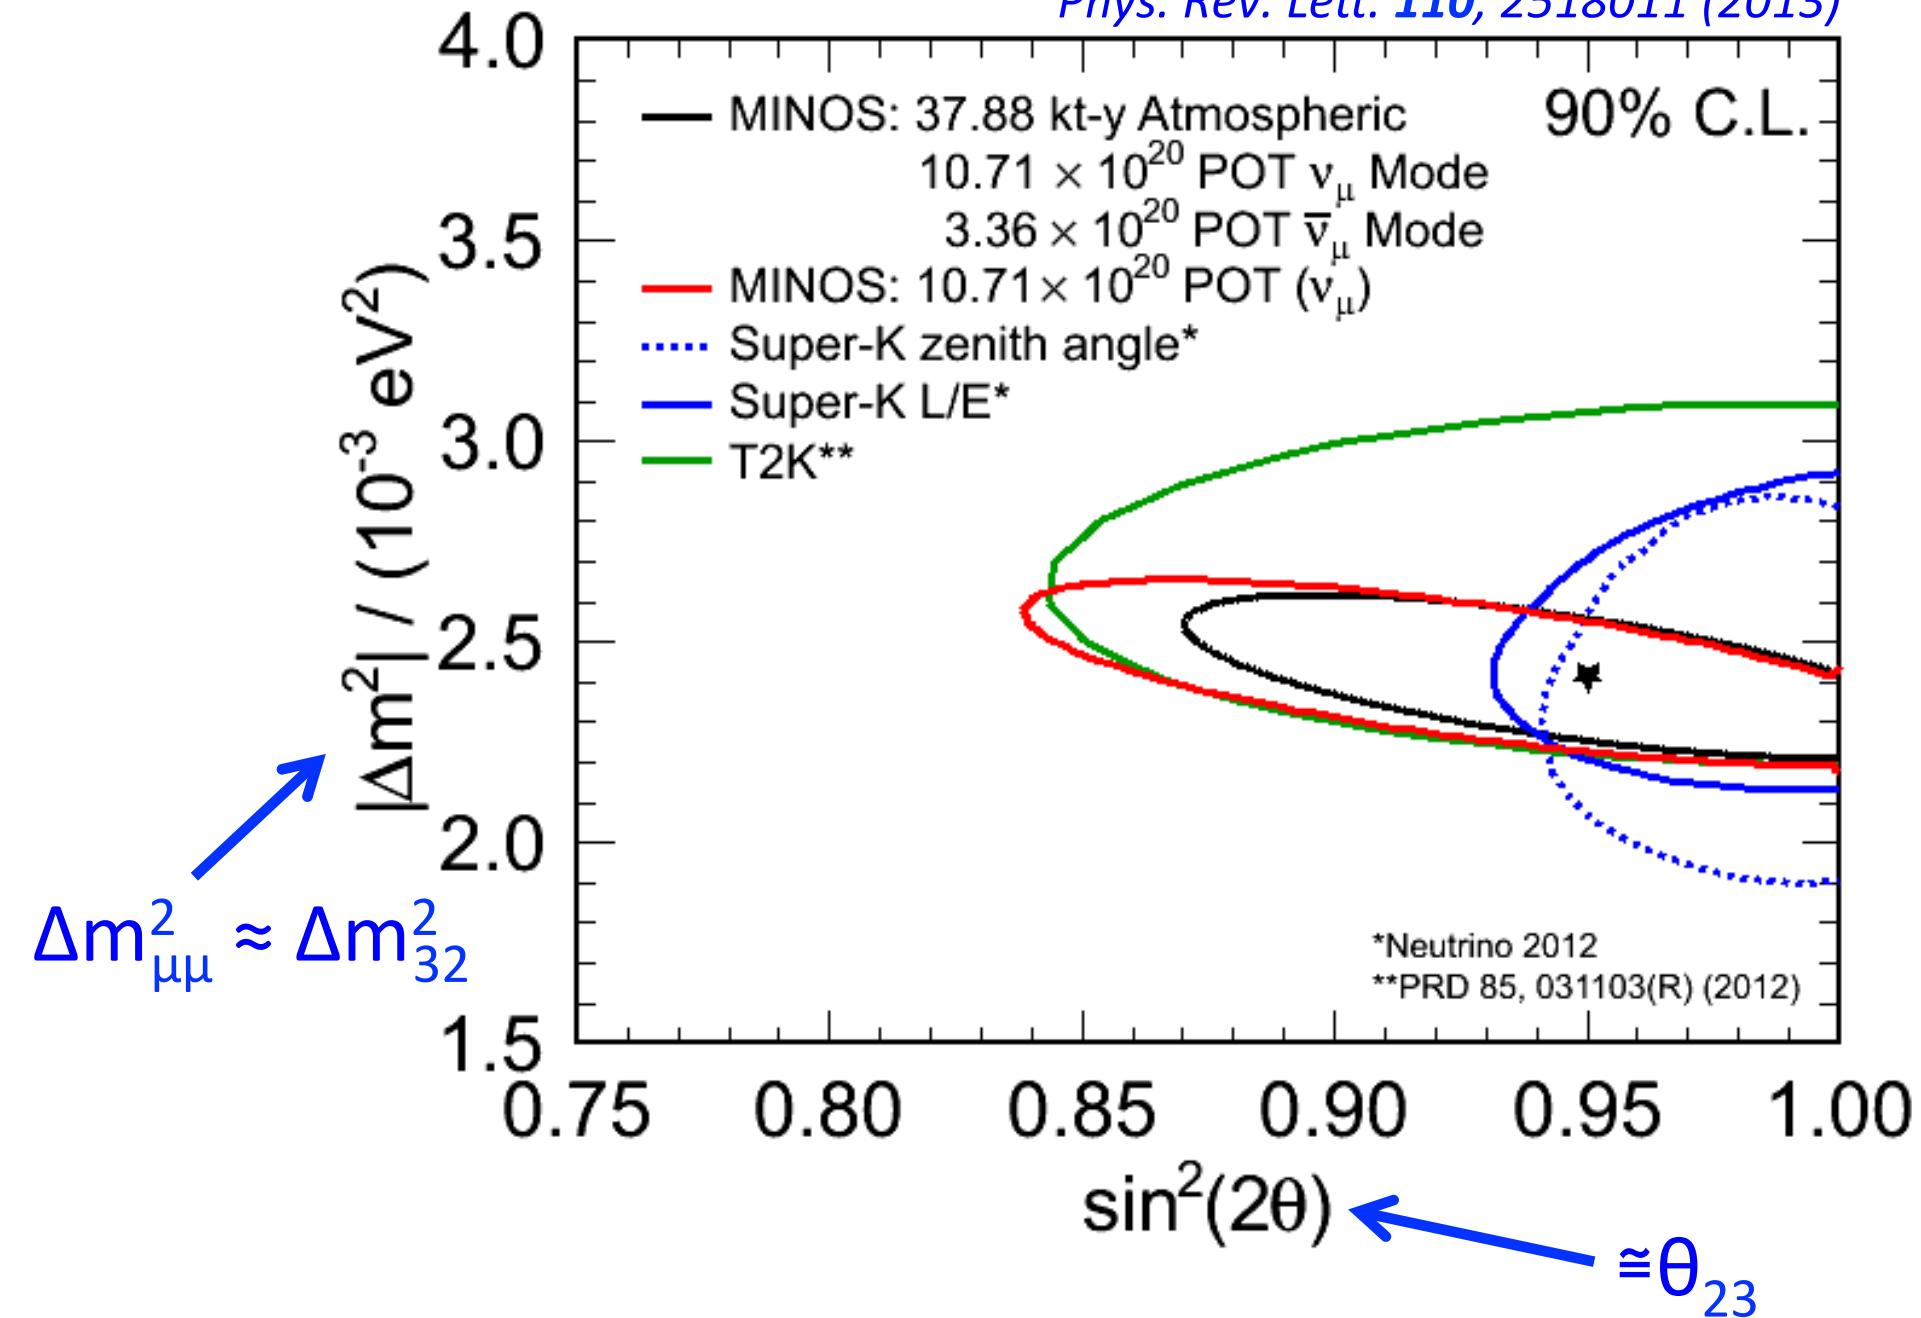

KamLAND and Solar Results

Phys. Rev. Lett. 100, 221803 (2008)
Phys. Rev. D83, 052002 (2011)

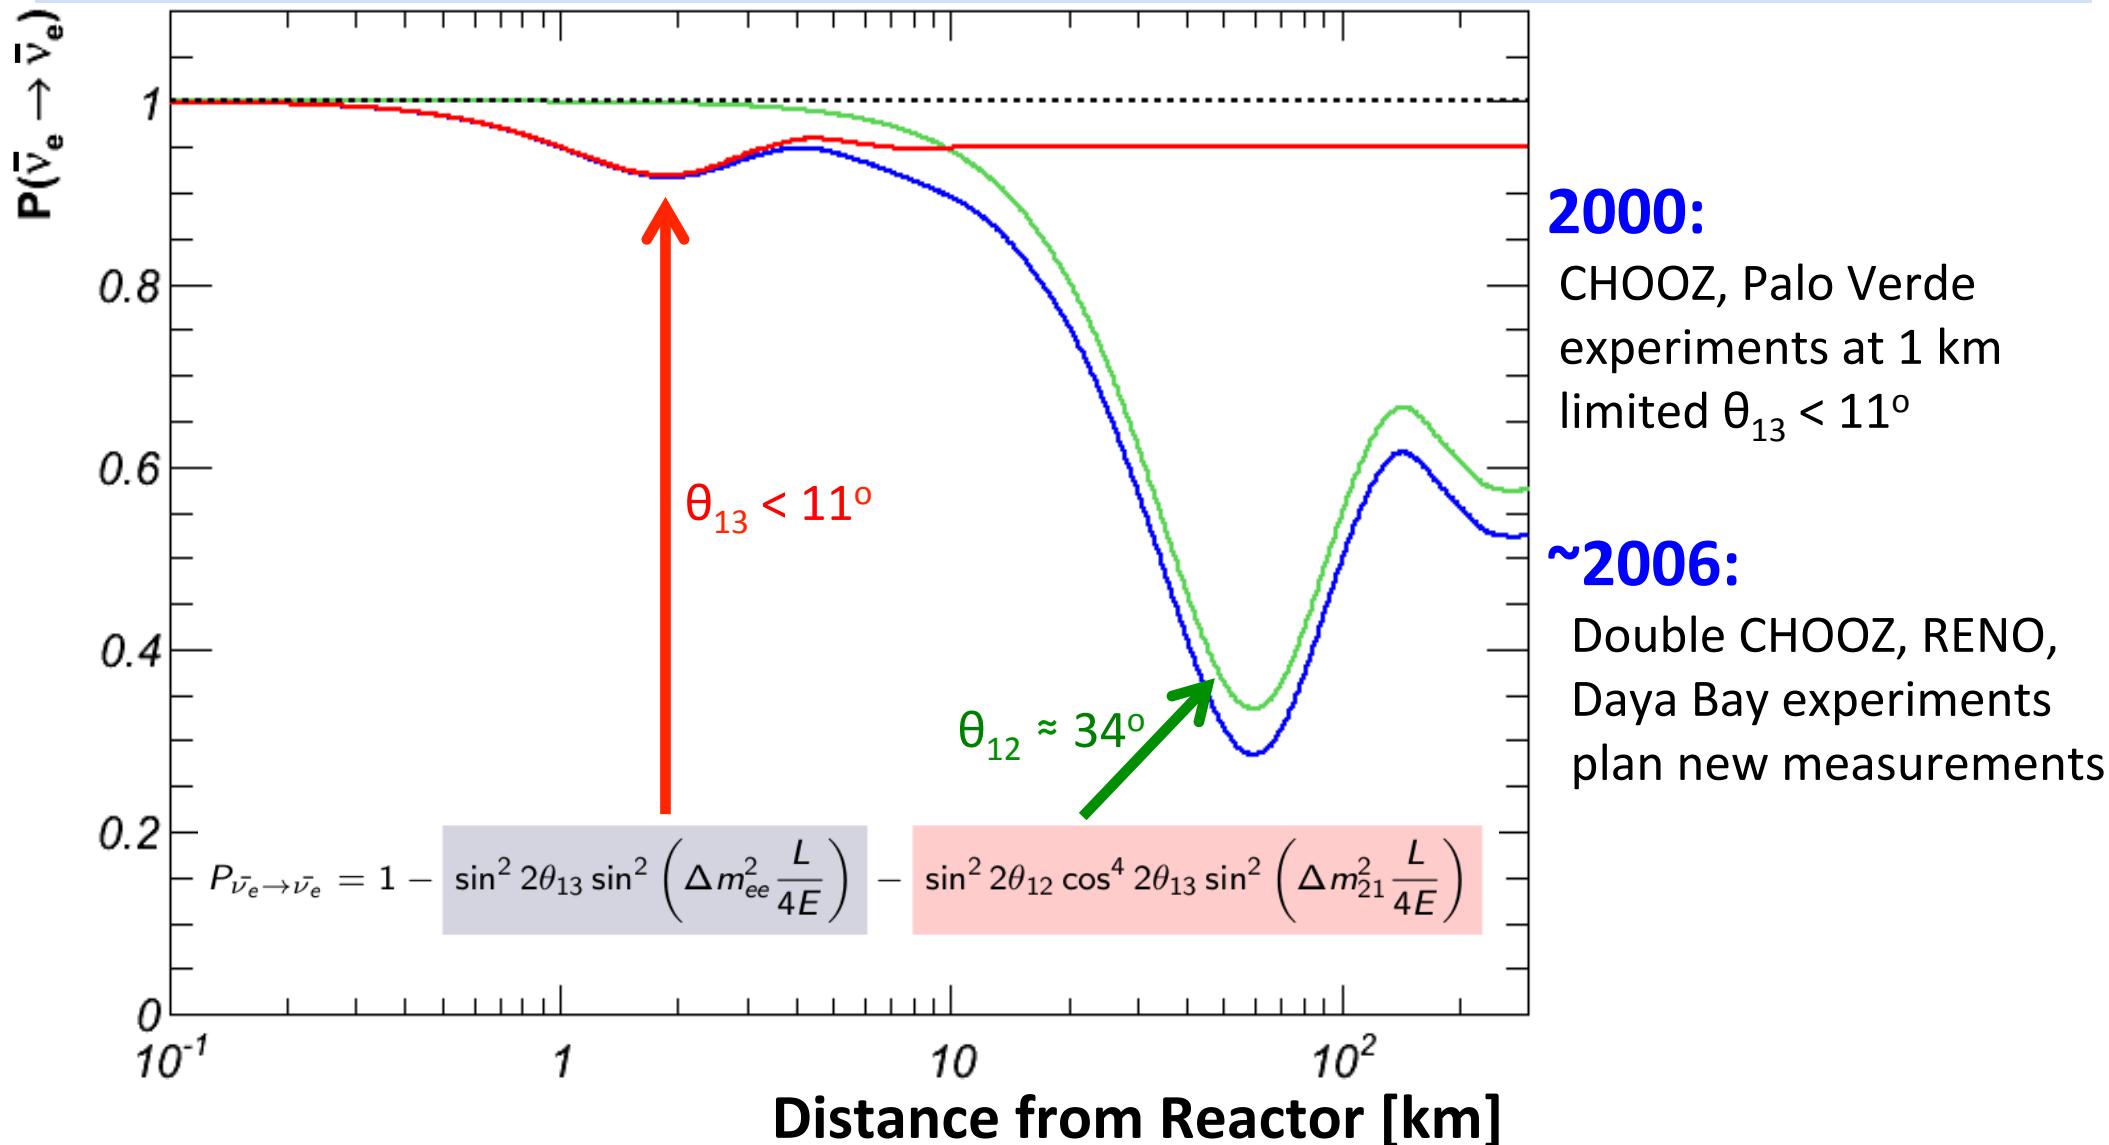

Accelerator and Atmospheric ν_μ

Phys. Rev. Lett. 110, 2518011 (2013)

θ_{13} : The Remaining Angle

Reactor $\bar{\nu}_e$ experiments sensitive to θ_{13} oscillation at ~ 1.6 km

Measuring θ_{13}

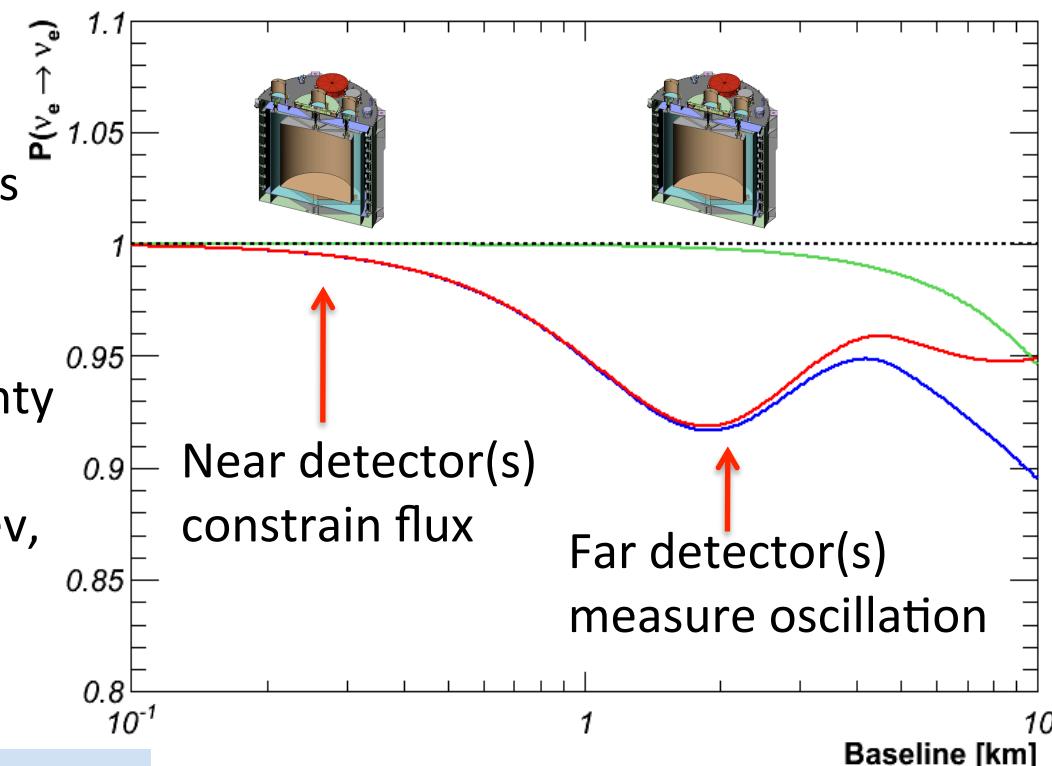

Absolute Reactor Flux:

Largest uncertainty in previous measurements

Relative Measurement:

Multiple detectors remove absolute uncertainty

First proposed by L. A. Mikaelyan and V.V. Sinev,
Phys. Atom. Nucl. **63**, 1002 (2000)

Far/Near ν_e Ratio

Distances from reactor

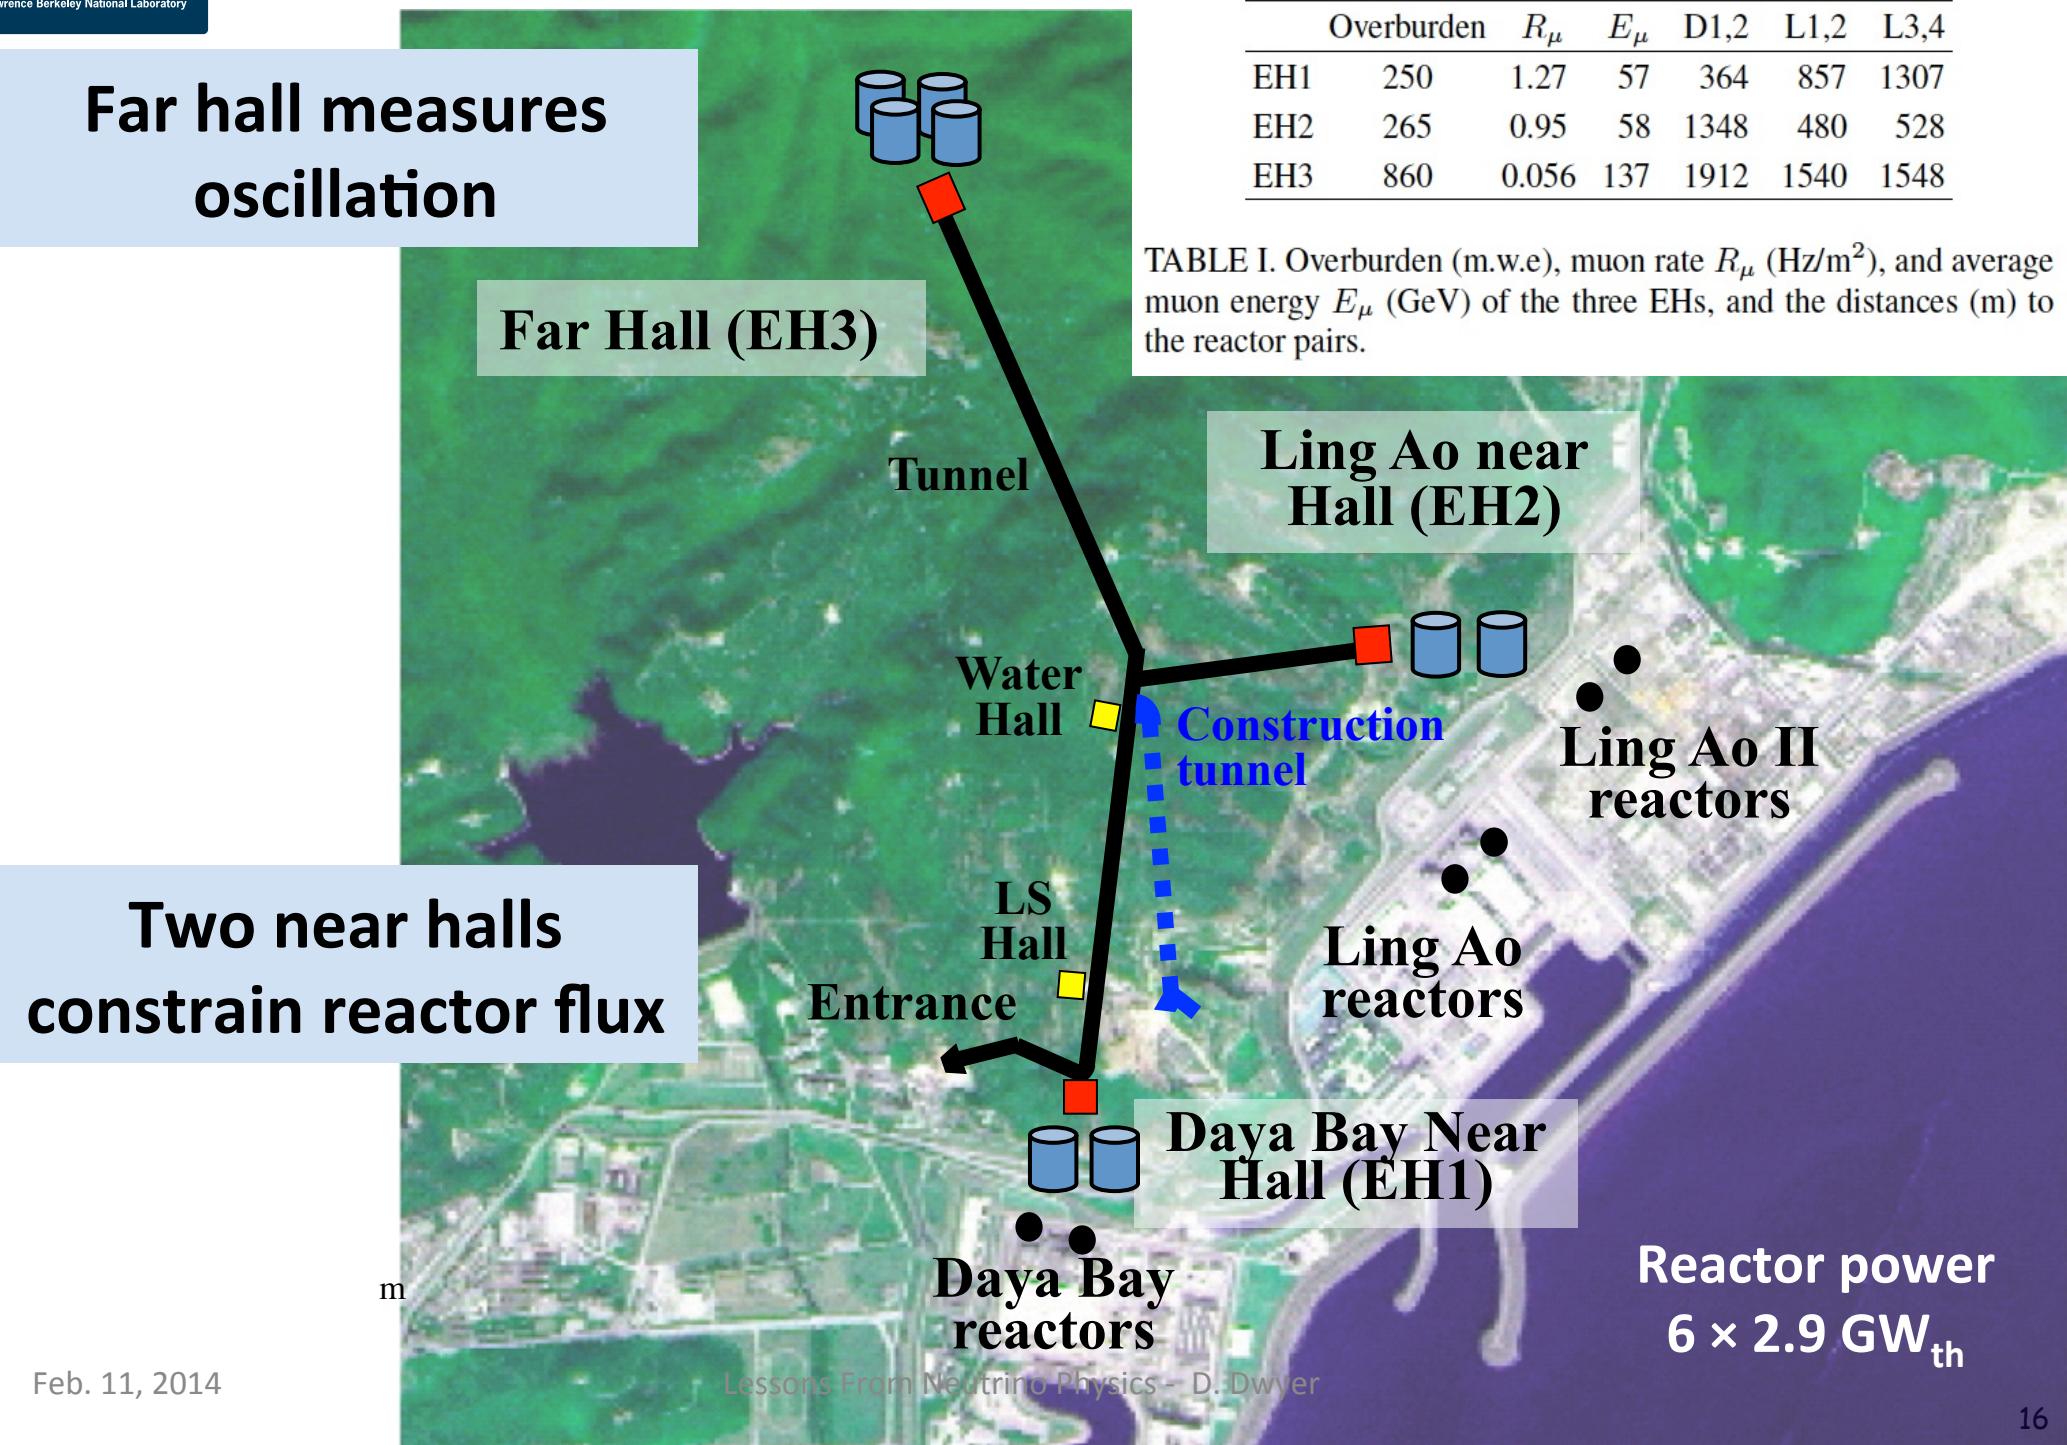

Oscillation deficit

$$\frac{N_f}{N_n} = \left(\frac{N_{p,f}}{N_{p,n}} \right) \left(\frac{L_n}{L_f} \right)^2 \left(\frac{\epsilon_f}{\epsilon_n} \right) \left[\frac{P_{\text{sur}}(E, L_f)}{P_{\text{sur}}(E, L_n)} \right]$$

Detector Target Mass

Detector efficiency

Experiment Layout

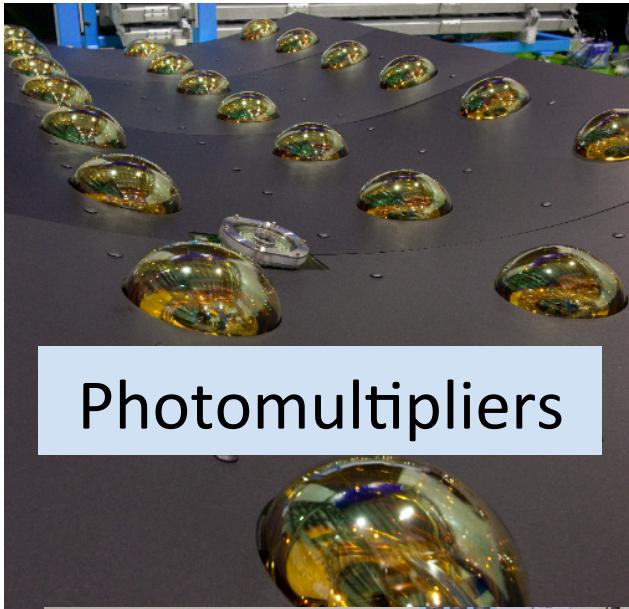

Lesson

Don't Complain!

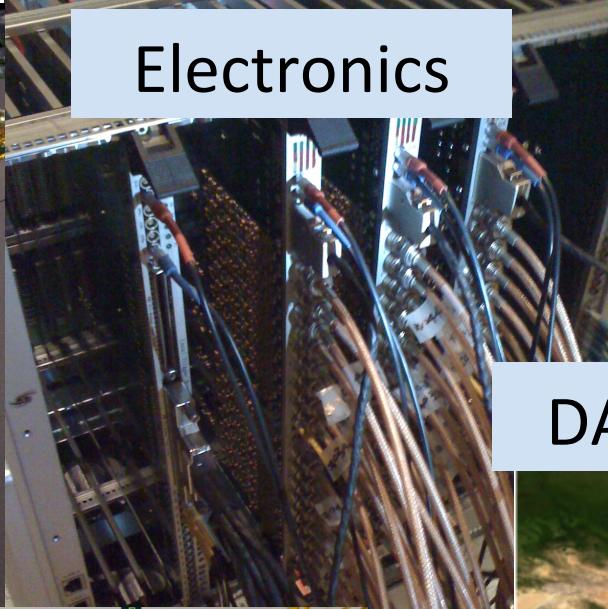

Commissioning

Punishment: Responsible for experiment integration

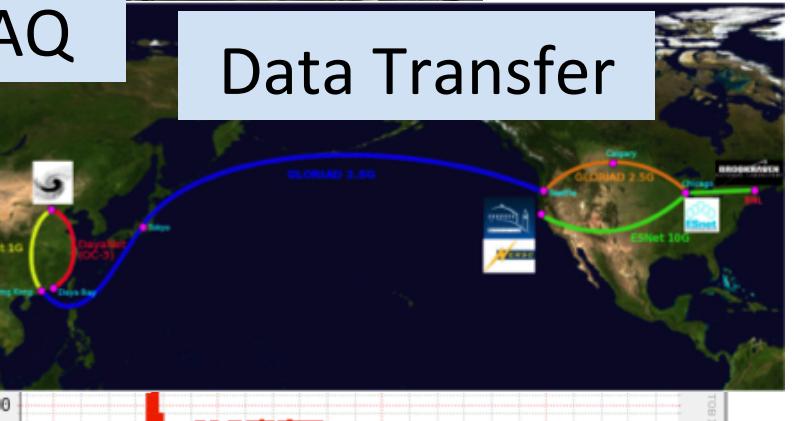

Photomultipliers

Electronics

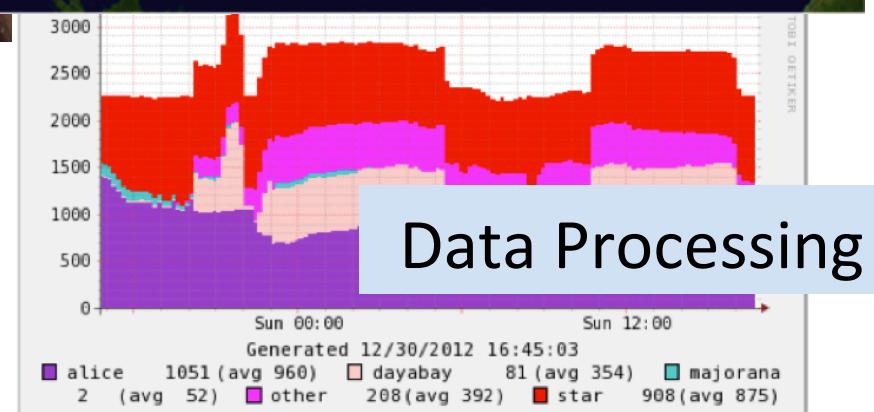

Automated
Calibration

Data Transfer

Detector Interfaces and Monitoring

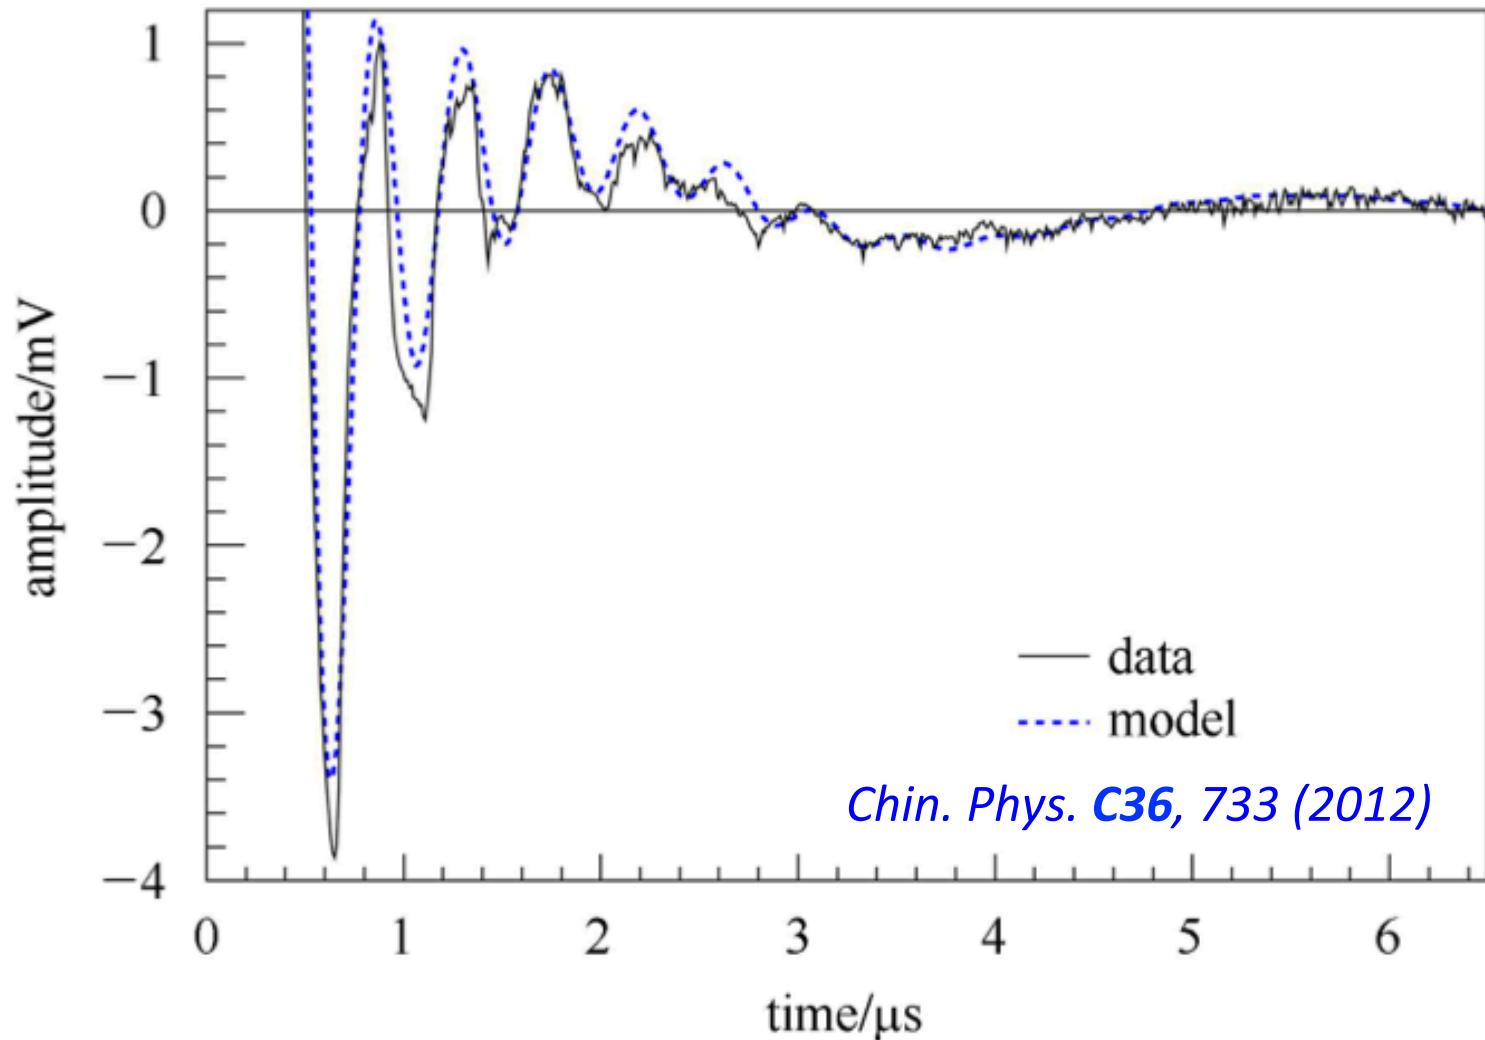

PMT Ringing

PMT/Electronics recovery essential for $\bar{\nu}_e$ measurement

Significant fluctuation following PMT pulse.

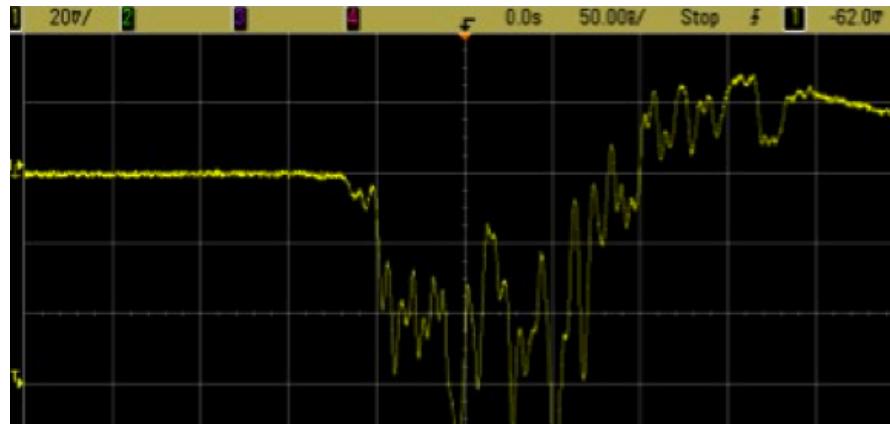

Issue mitigated via improvements in electronics.

Developed empirical model to simulate PMT and electronics.

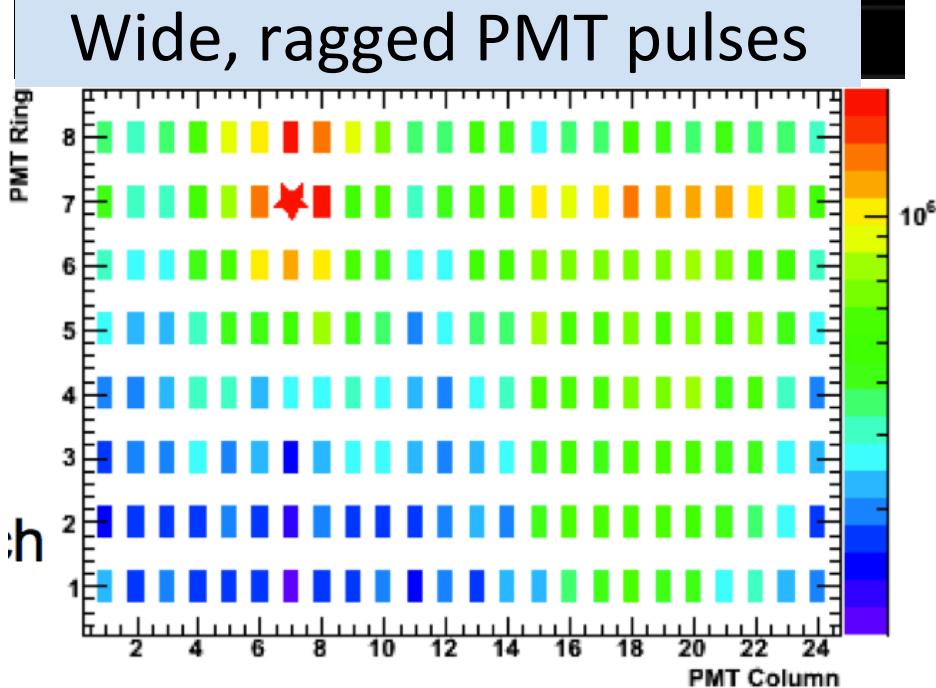

PMT Light Emission

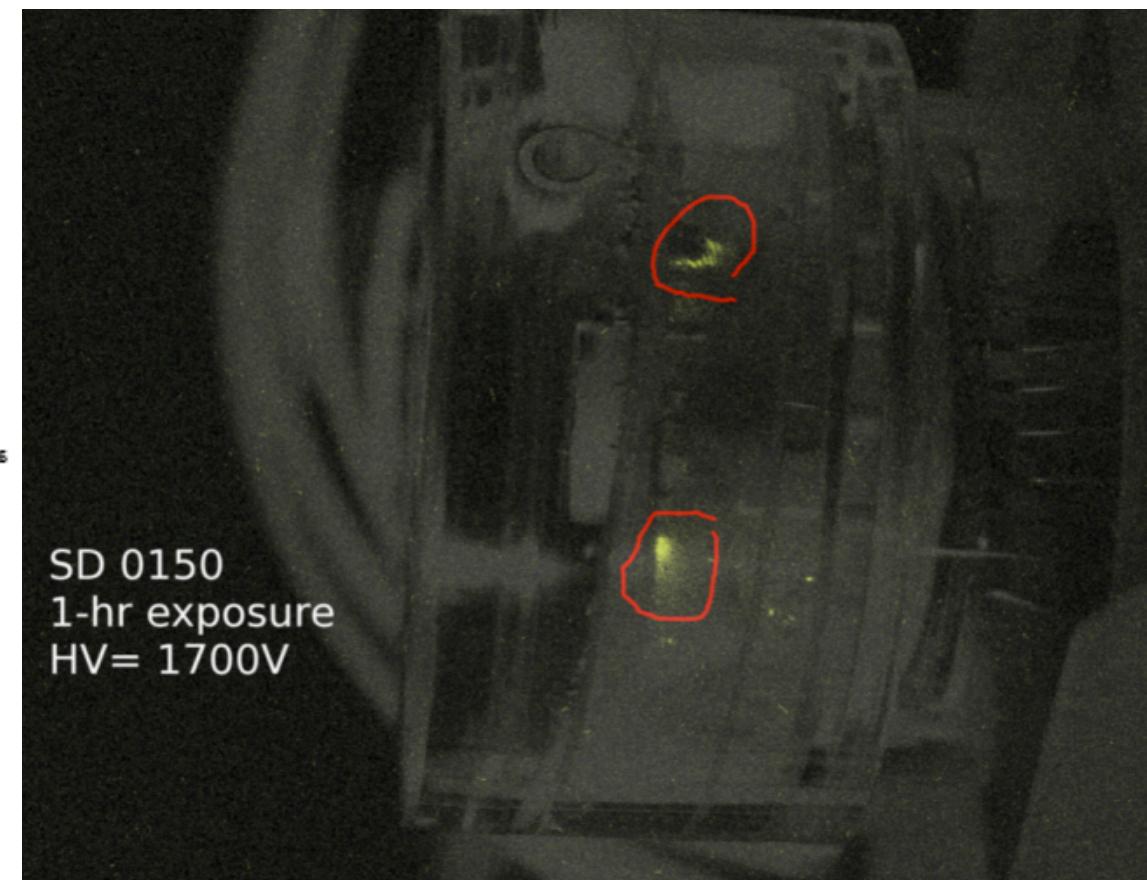

Unexpected noise due to PMT light emission

Light emission localized to PMT base

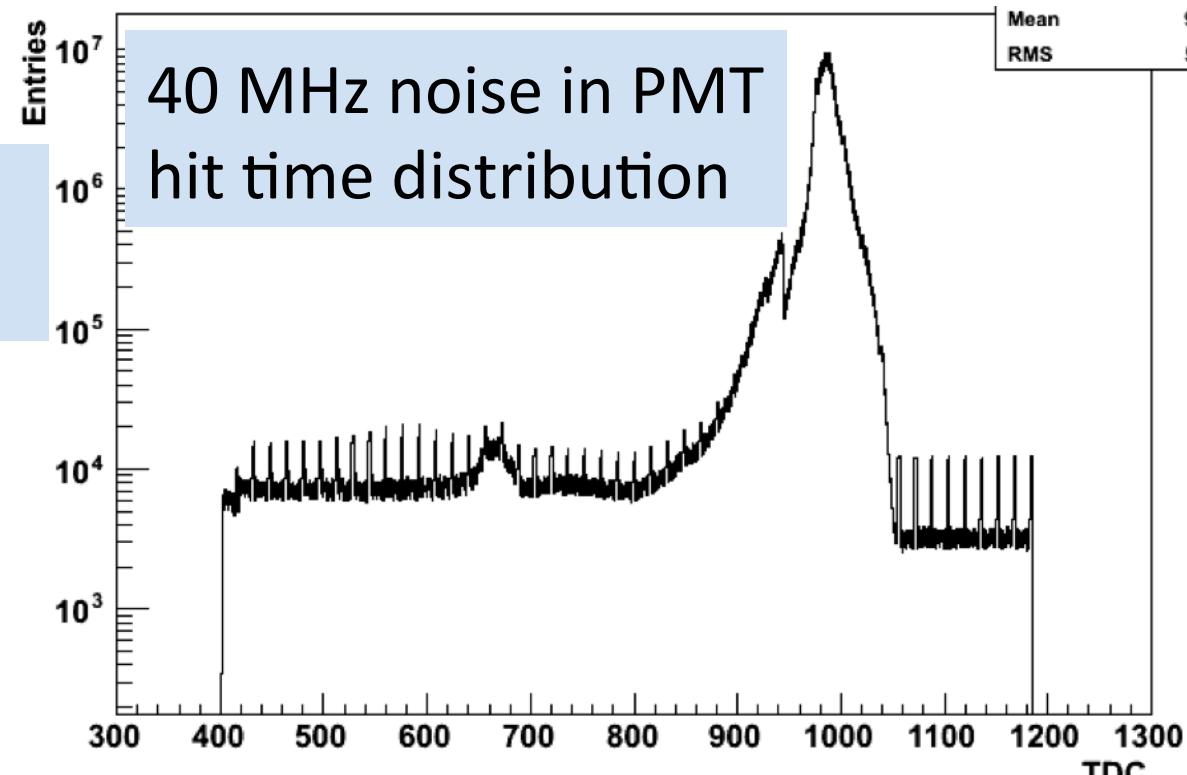

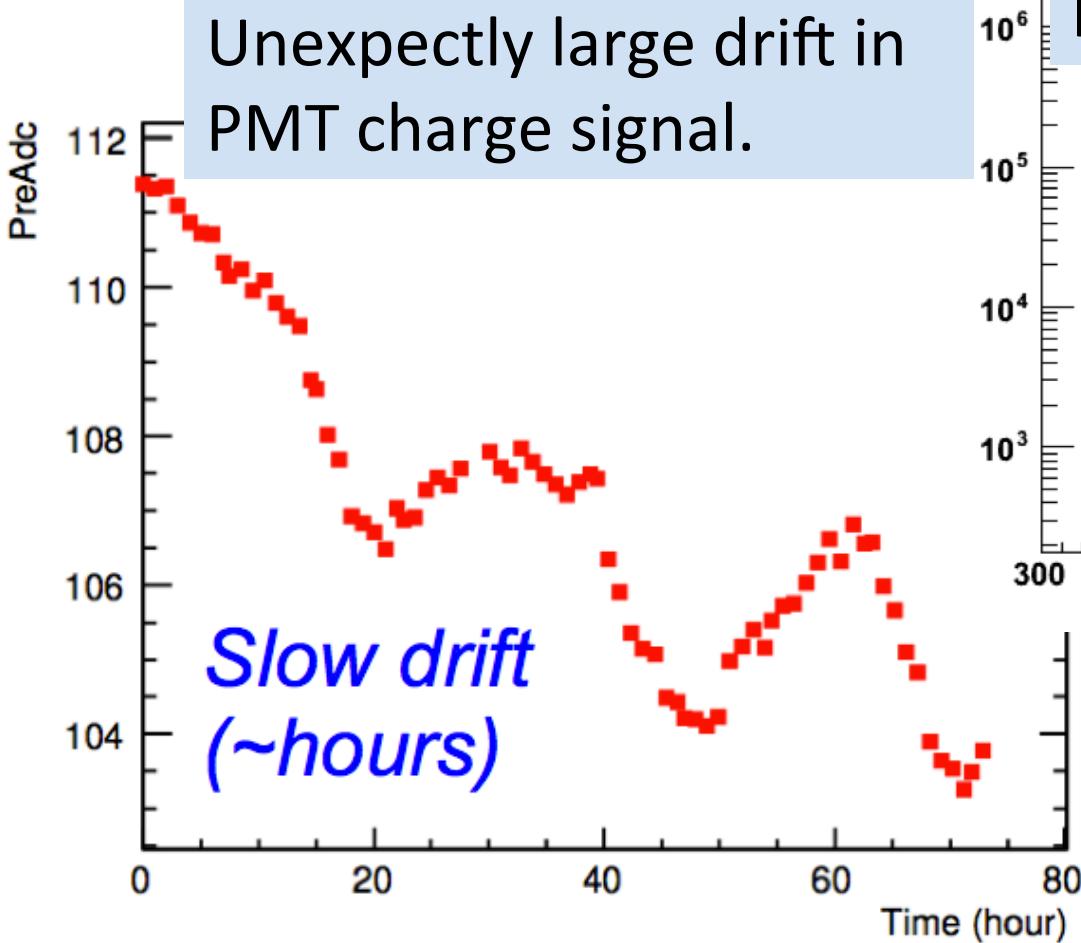

Unique hit pattern in detector

Electronics and Triggering

Identified unexpected features of electronics and triggering

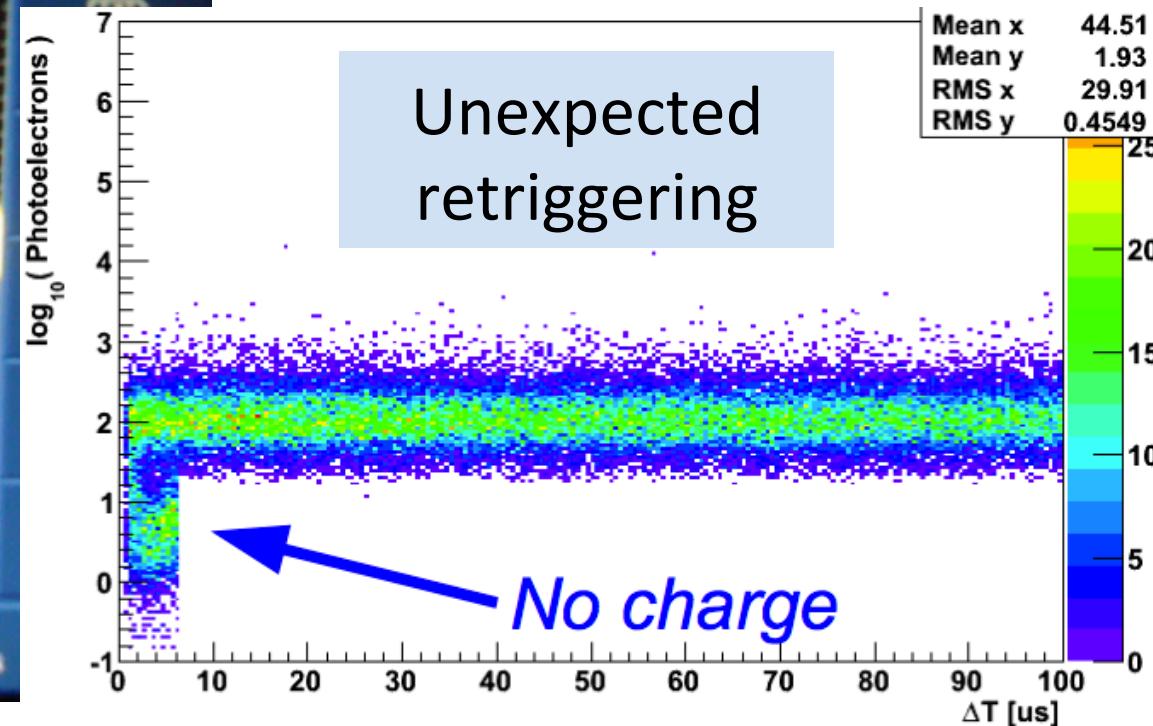

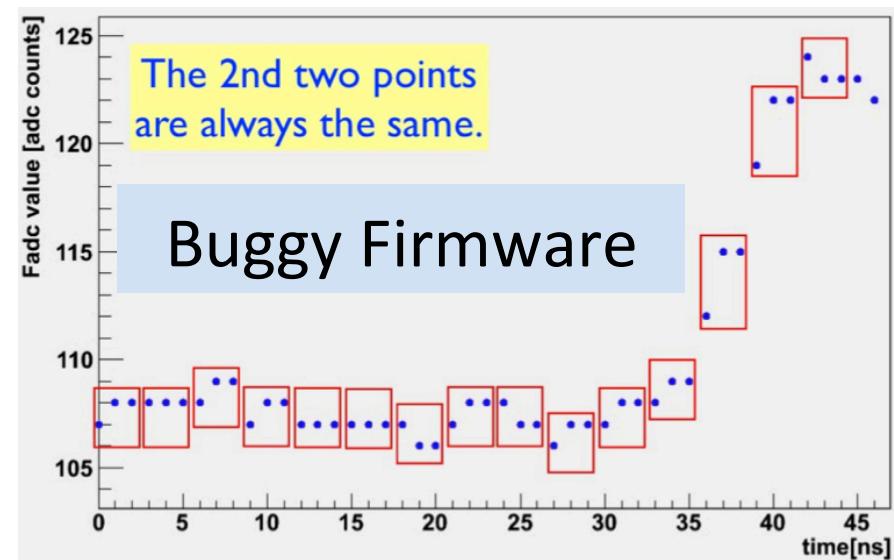

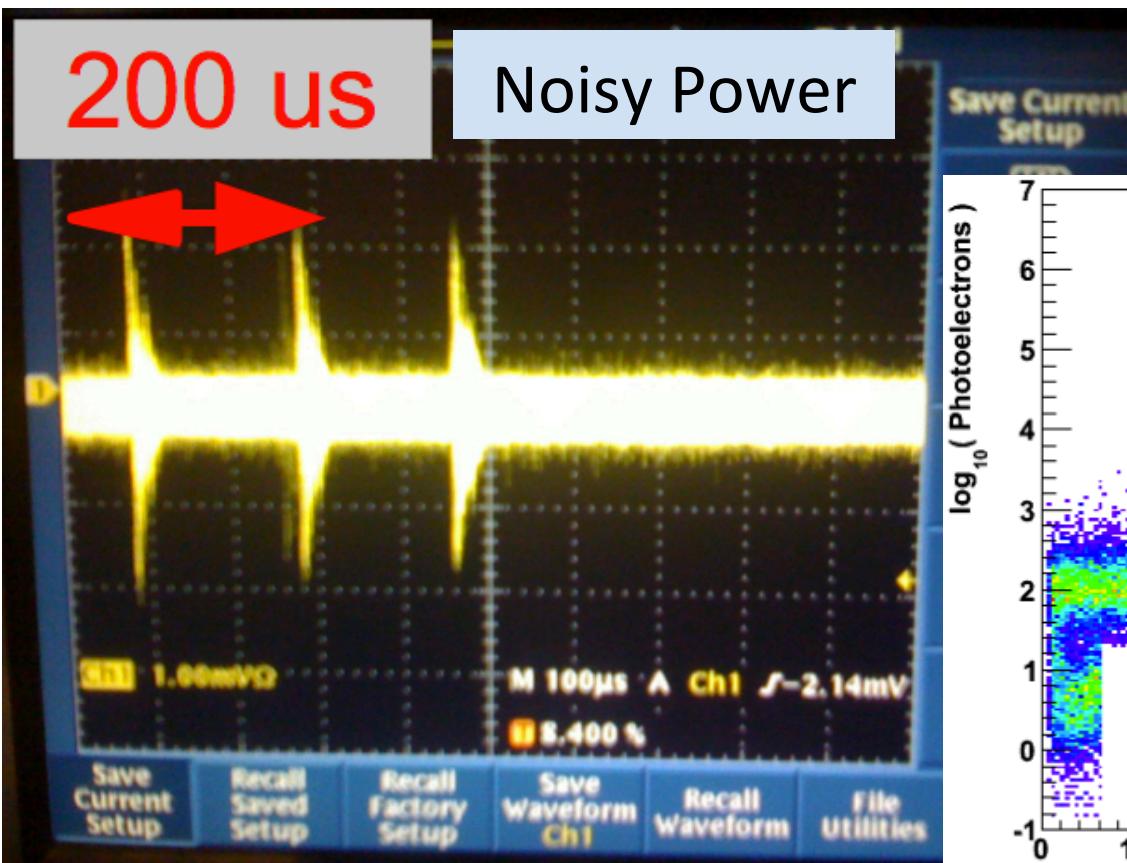

Early commissioning results led to improvements in electronics design.

Electronics and Triggering

Many other issues found and fixed

- Unexpected gaps in data
- Event times in 1970
- Same PMT signal present in two events
- Electronics time offset jumps

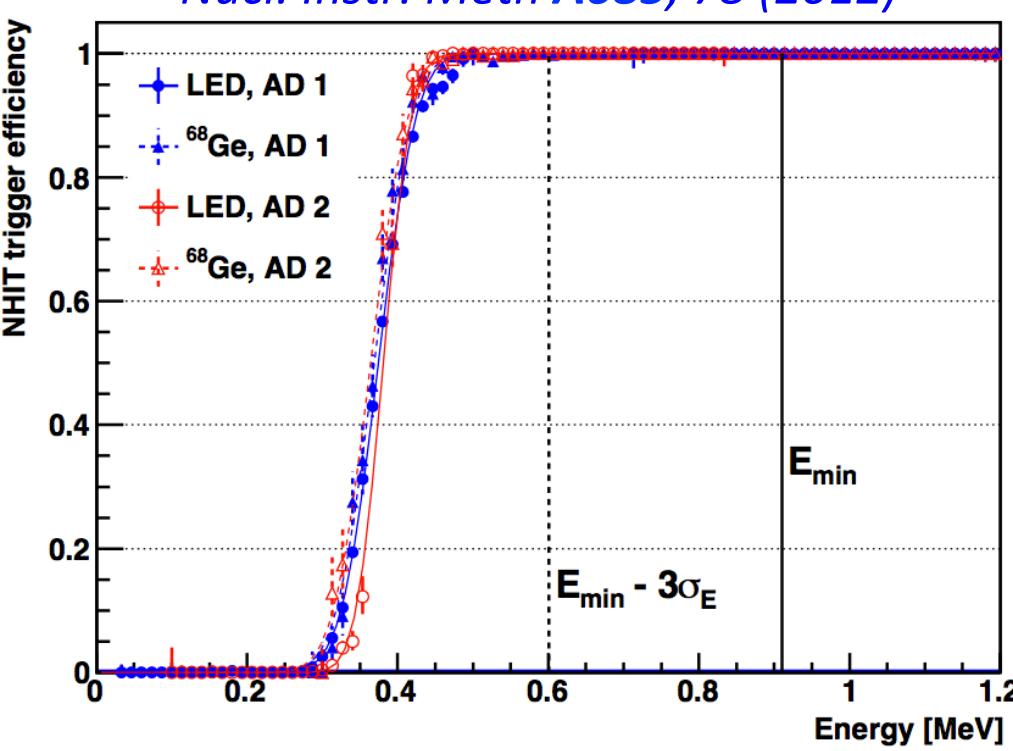

:/

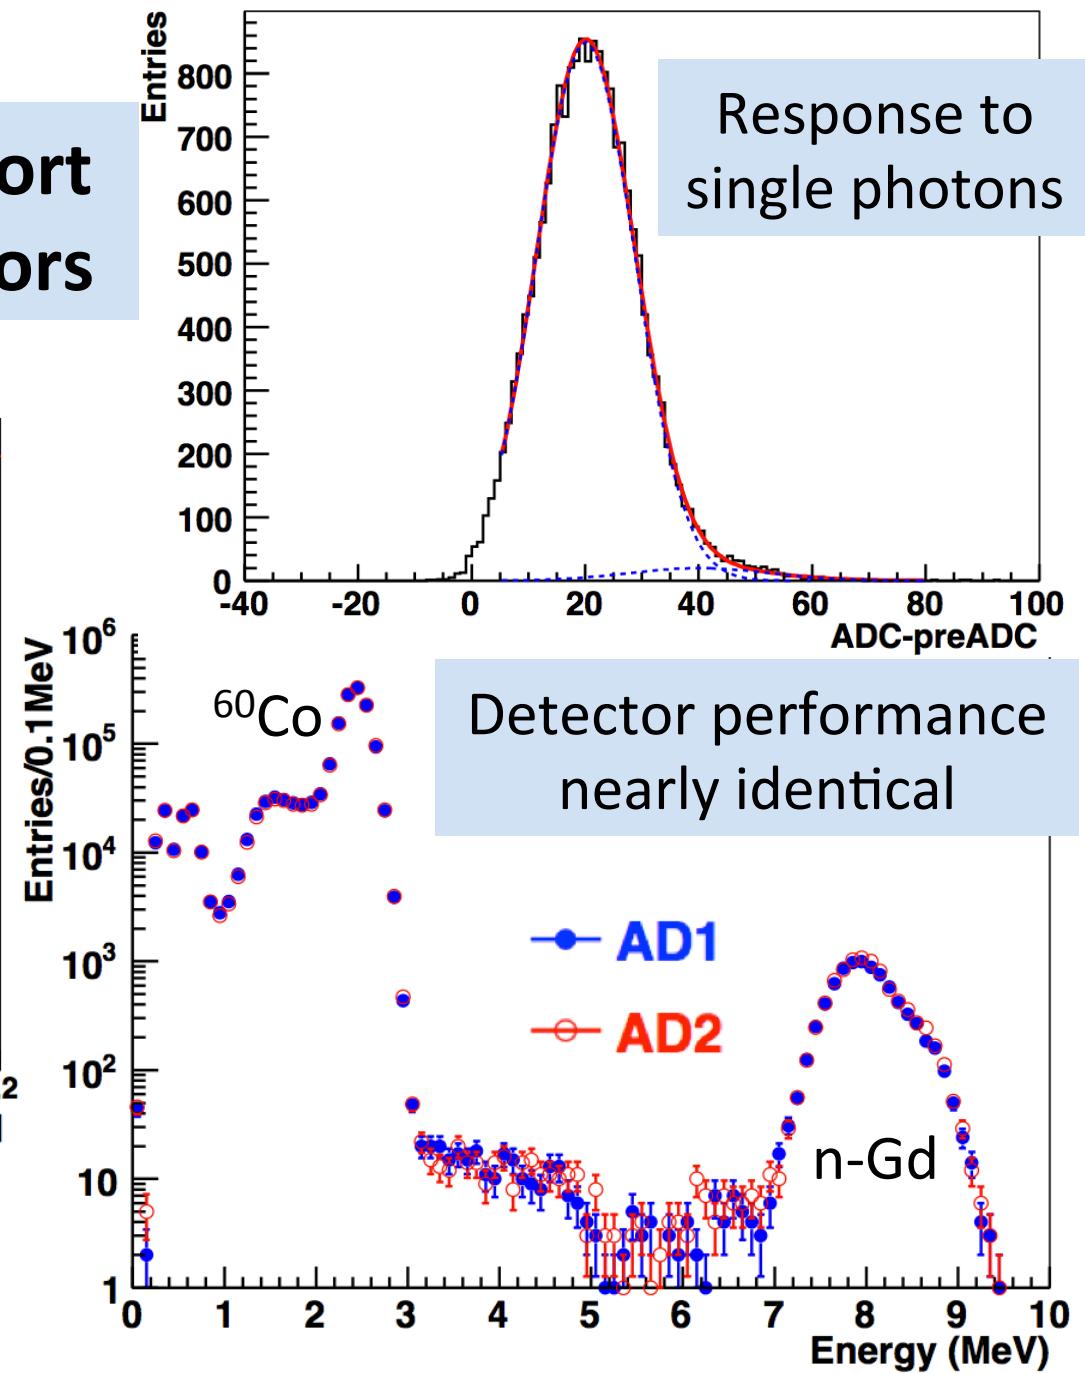

Good Outcome

Extensive commissioning effort resulted in successful detectors

Trigger efficiency sufficient for antineutrino detection

Response to single photons

Detector performance nearly identical

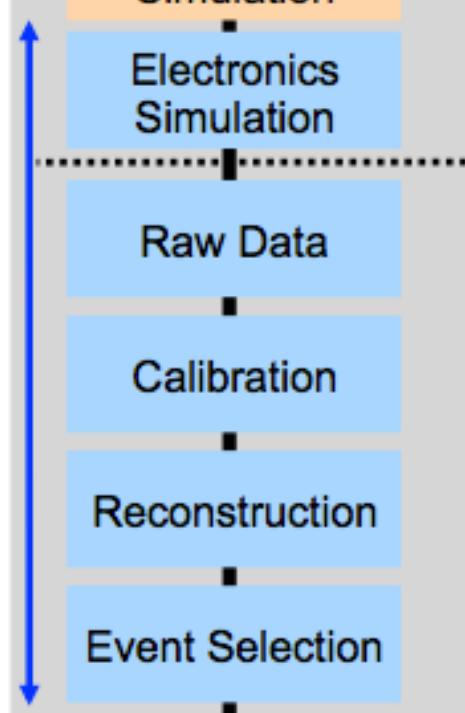

Lesson

Analysis Examples (or A Treatise on Cat-skinning)

What is the best / simplest / fastest way for me to examine event data and generate my histograms?

If this is your question, then please read this section. As discussed in the preceding sections, you can directly use ROOT to inspect NuWa event data files. Within ROOT, there are a few different methods to process event data. Alternatively, you can use the full power NuWa to process data. To demonstrate these different methods, a set of example scripts will be discussed in this section. Each example script generates the exact same histogram of number of hit PMTs versus reconstructed energy in the AD, but uses how to "chain" trees from multiple files, and how to "friend" data trees be found in the [dybgaudi:Tutorial/Quickstart](#) software package.

- `dybTreeDraw.C`: ROOT script using `TTree::Draw()`
- `dybTreeGetLeaf.C`: ROOT script using `TTree::GetLeaf()`
- `dybTreeSetBranch.C`: ROOT script using `TTree::SetBranchAddress()`
- `dybNuWaHist.py`: NuWa algorithm using the complete data classes

Analysis Manual
and Tutorials

First Look

Sent out first Near vs. Far $\bar{\nu}_e$ on Christmas morning

Daya Bay:

Anti-neutrinos
detected at all
three sites.

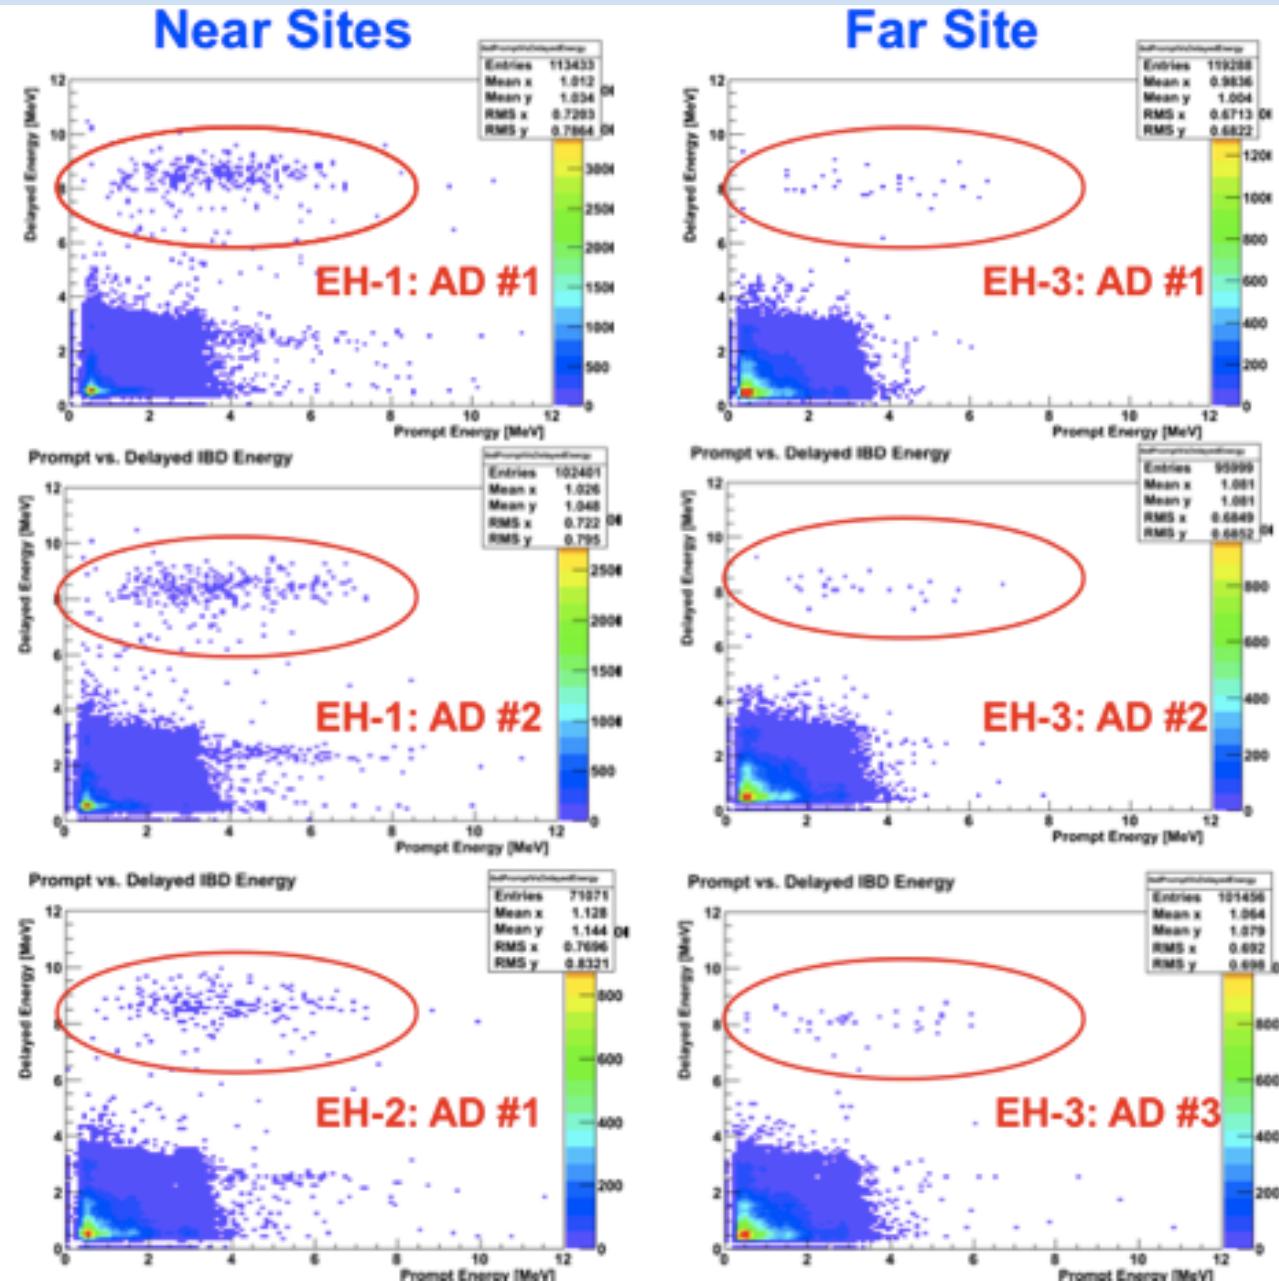

(see circled events)

First 10 hours
of data.

Merry Christmas!

Run Numbers:

EH-1: 21221
EH-2: 21222
EH-3: 21223

Lesson

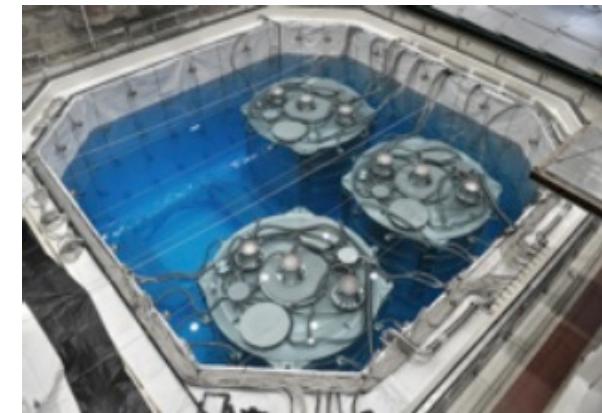

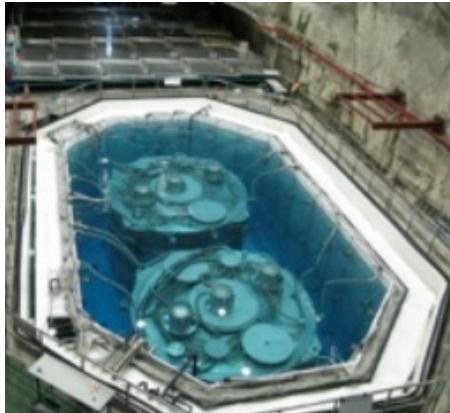

When you assume...

Bigger than Expected

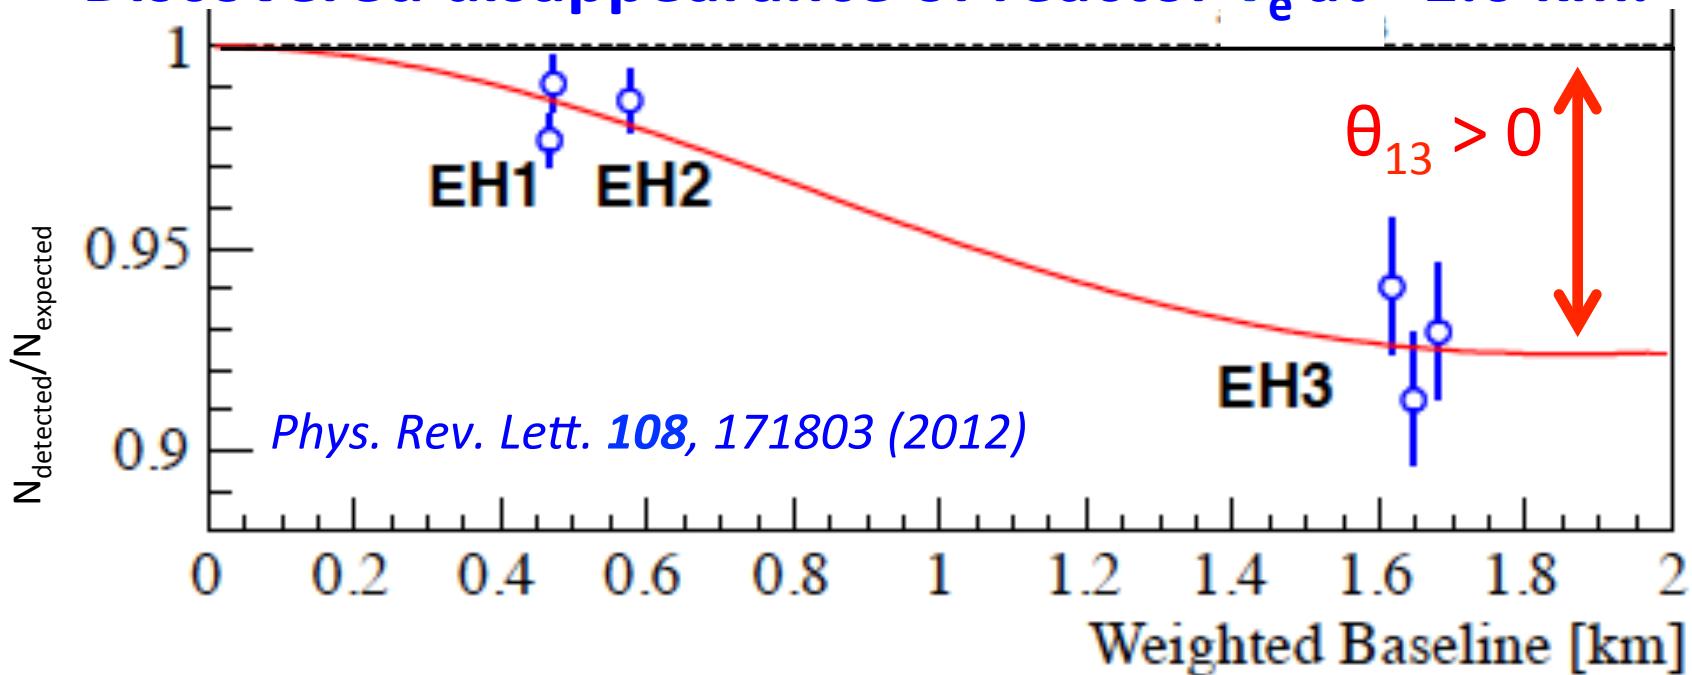

Discovery of $\bar{\nu}_e$ disappearance

March 2012: Using 55 days of data with 6 detectors,

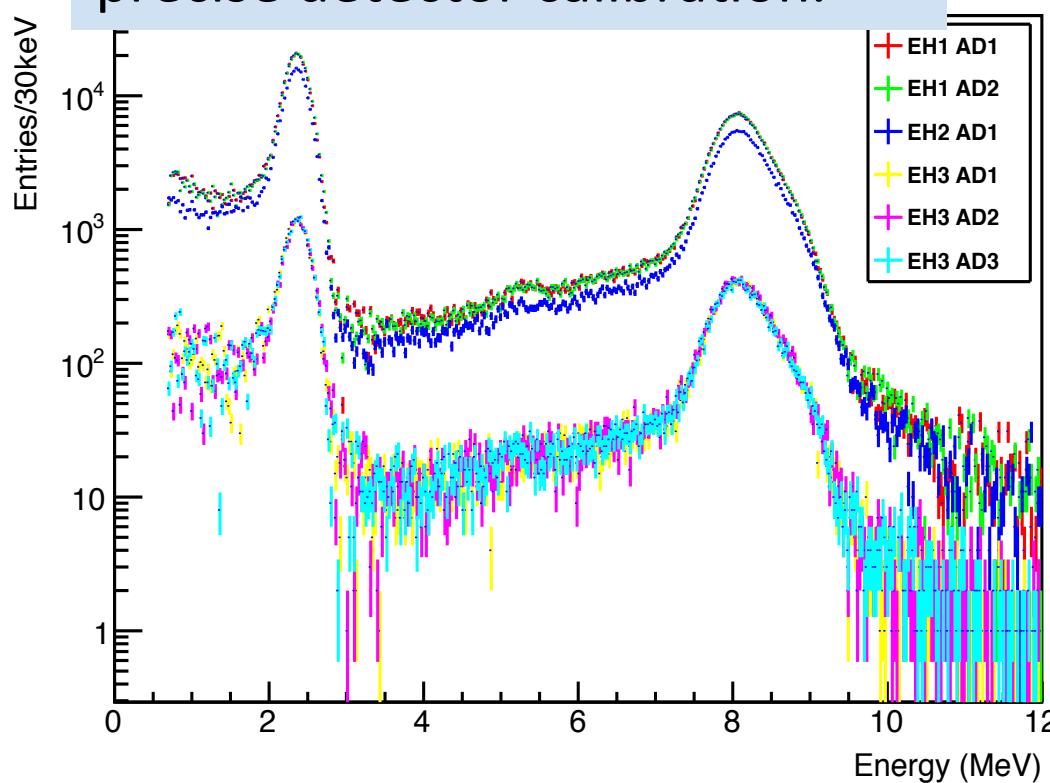

Discovered disappearance of reactor $\bar{\nu}_e$ at ~ 1.6 km.

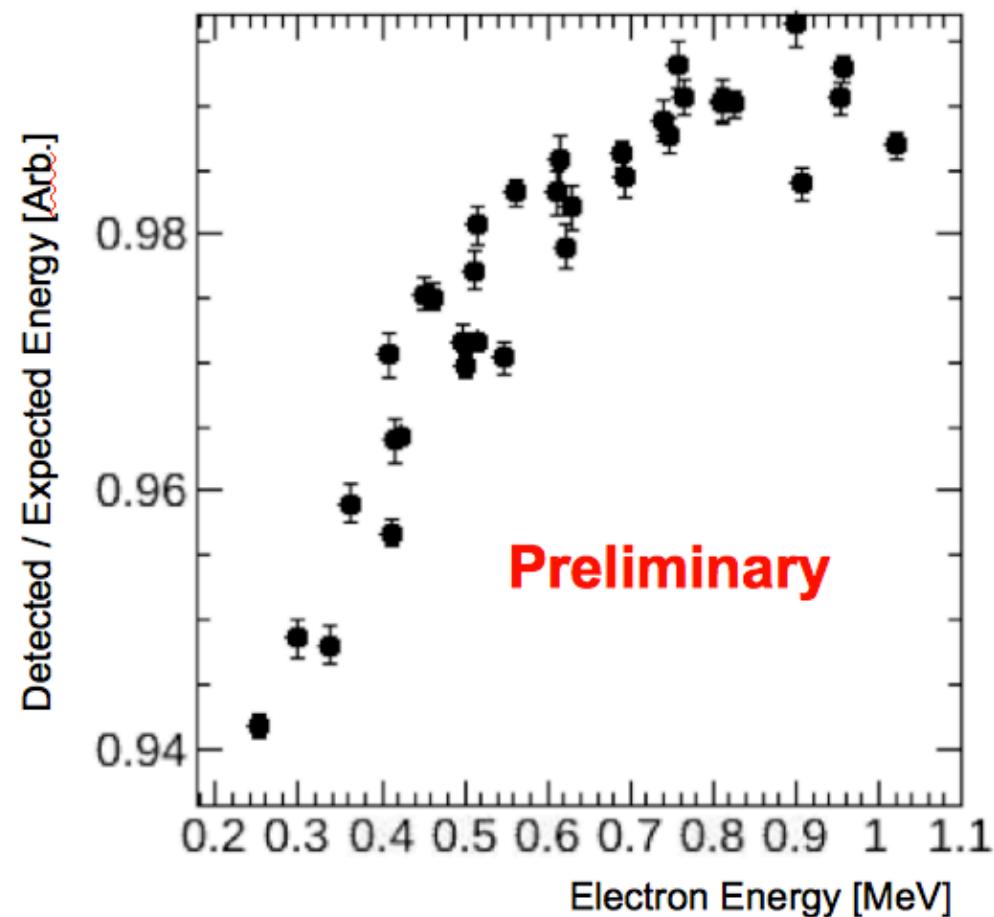

New Approaches

Explore new methods to improve calibration and analysis

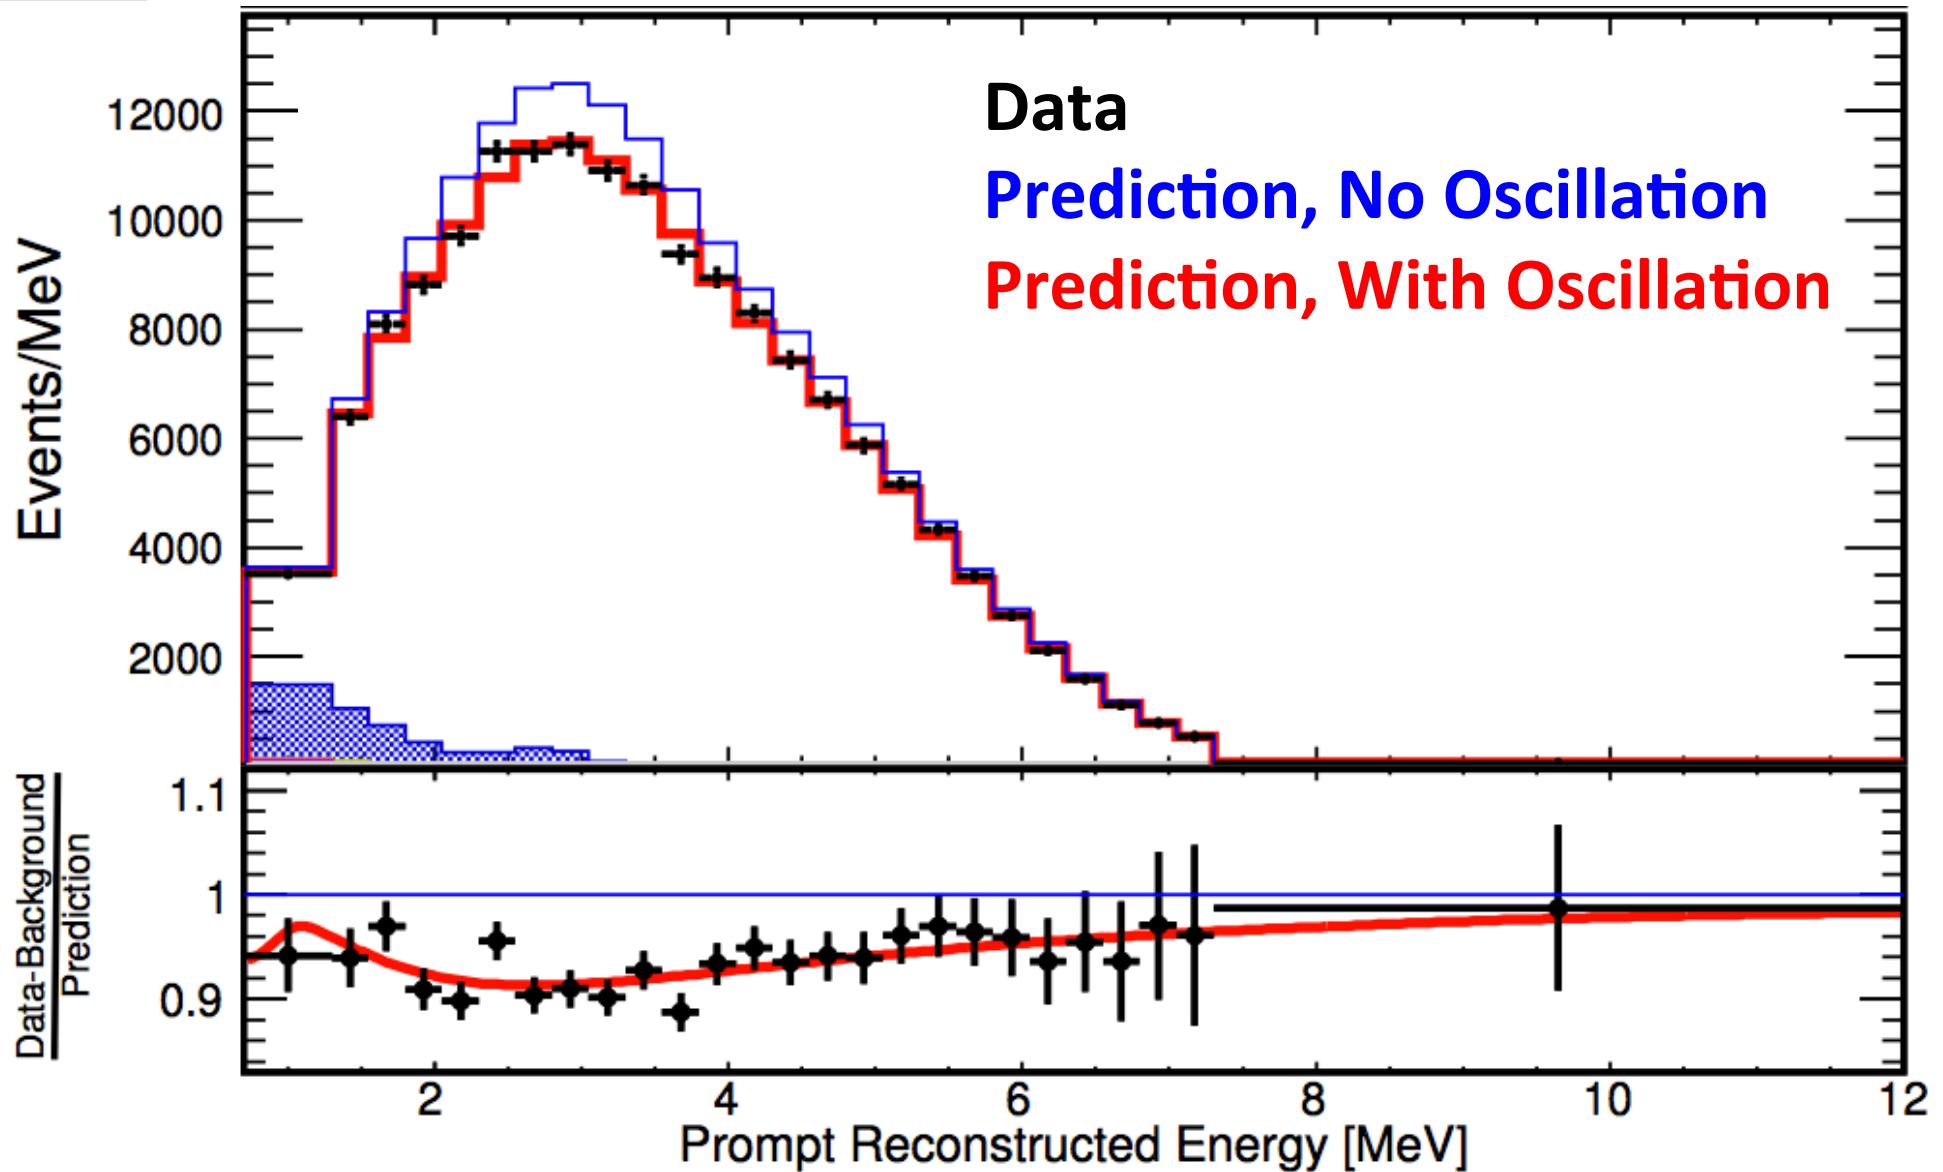

Use cosmogenic neutrons for precise detector calibration.

Measure energy nonlinearity in-situ and ex-situ.

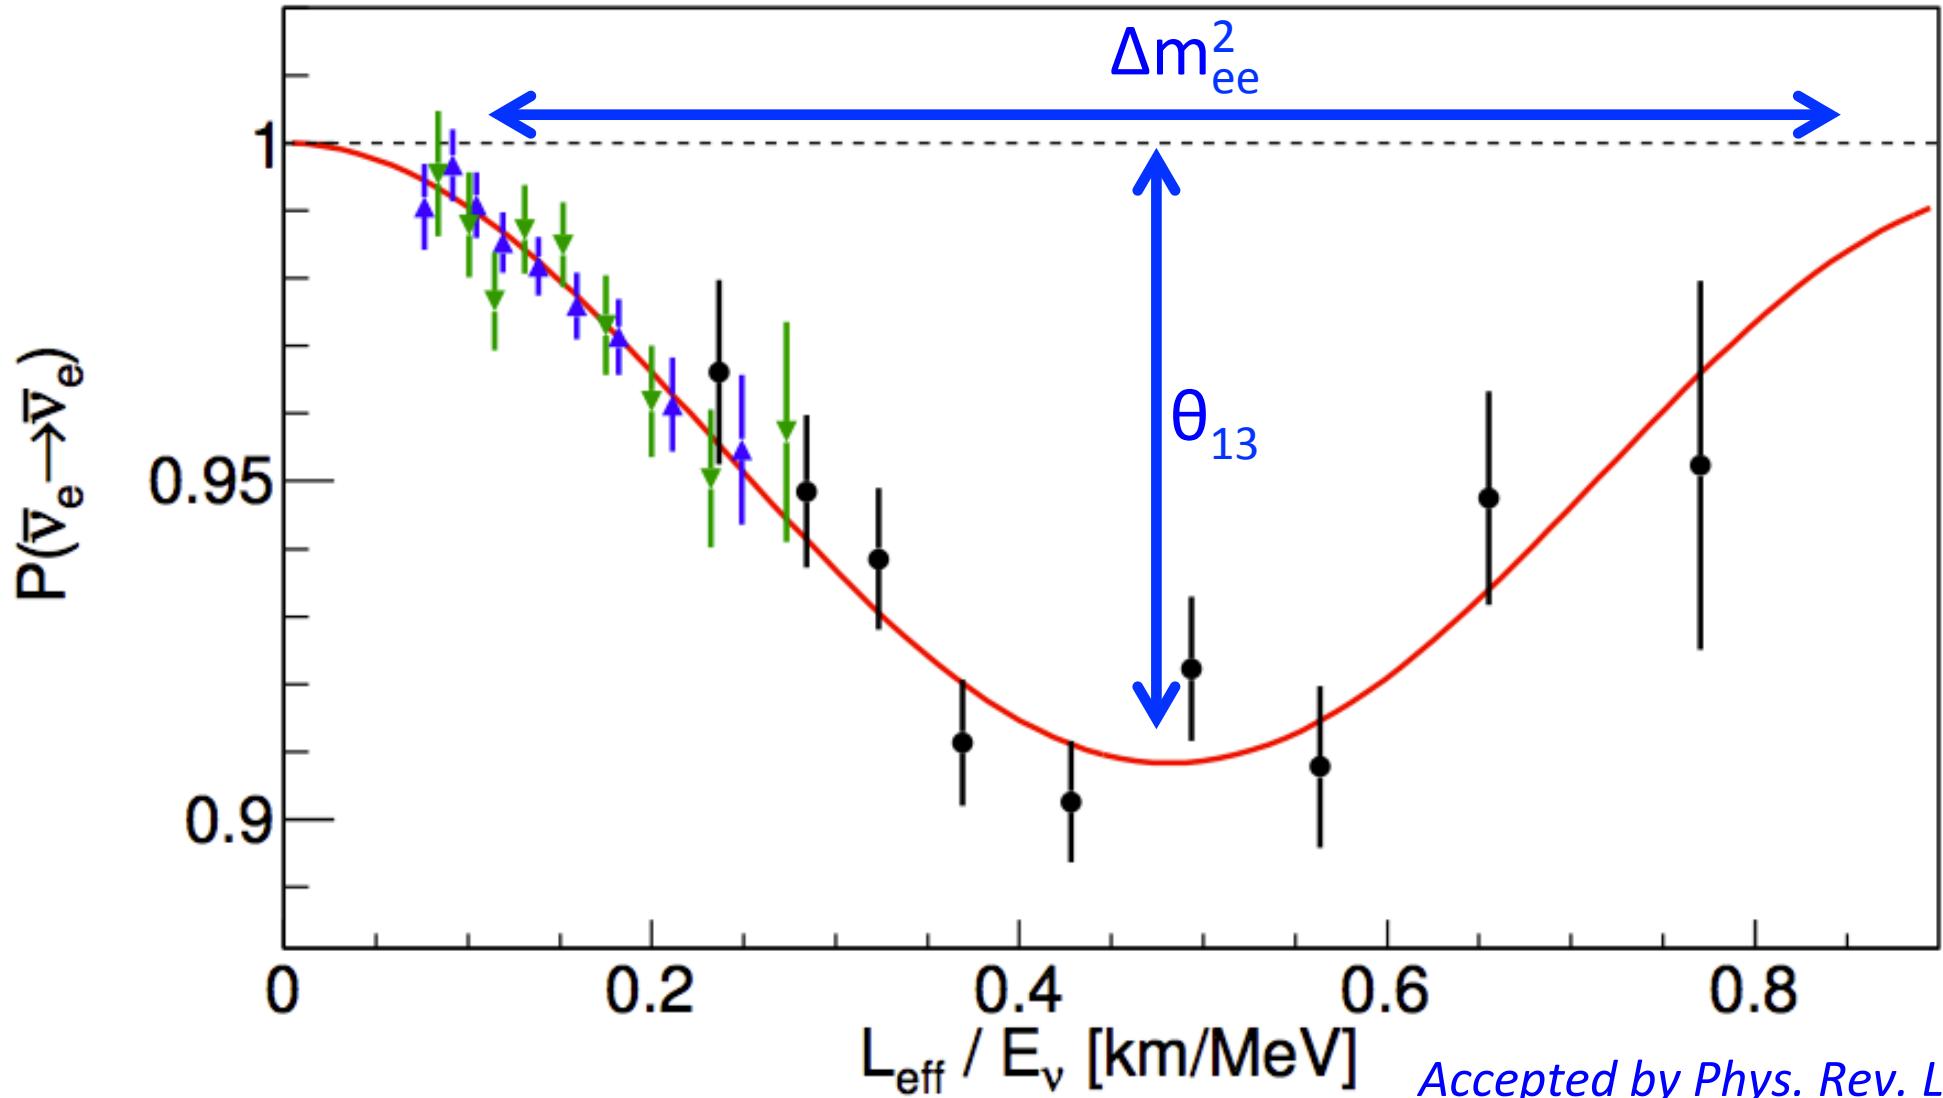

Spectral Distortion

Spectral distortion consistent with oscillation model

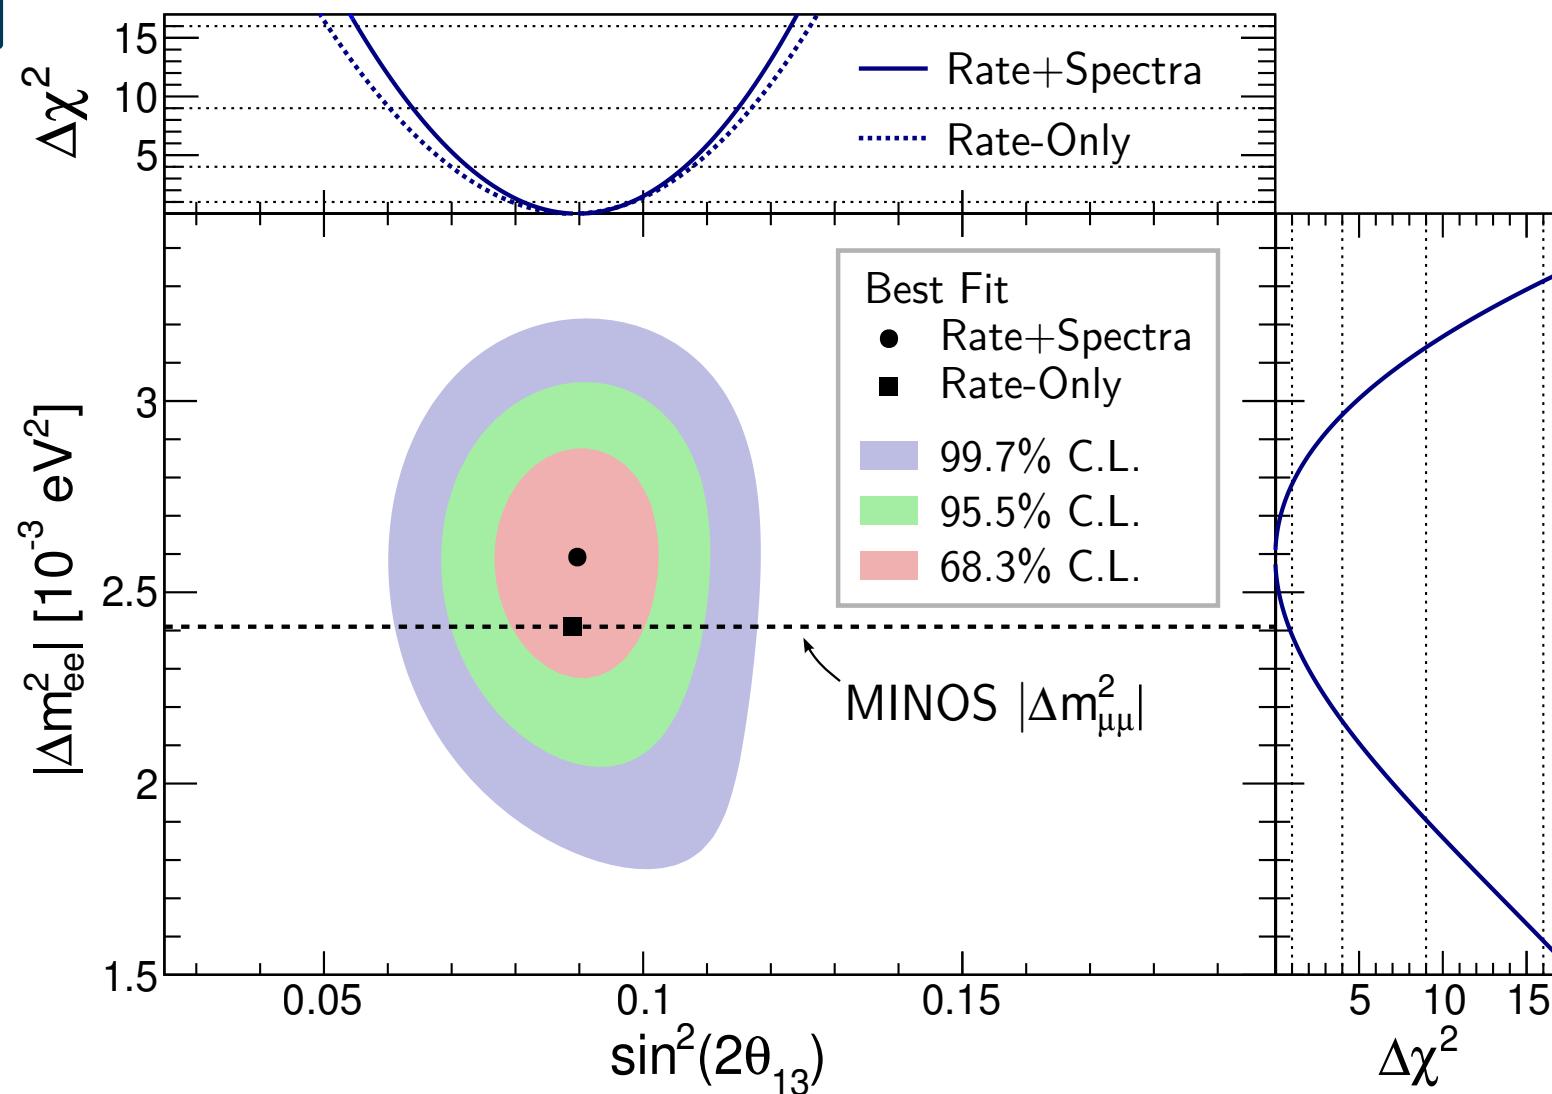

Antineutrino Oscillation

Recast spectral distortion as $\bar{\nu}_e$ proper time (L/E)

Accepted by Phys. Rev. Lett.

Rate+Spectra Oscillation Results

$$\sin^2 2\theta_{13} = 0.090^{+0.008}_{-0.009}$$

$$|\Delta m^2_{ee}| = 2.59^{+0.19}_{-0.20} \times 10^{-3} \text{ eV}^2$$

Strong confirmation of oscillation-interpretation of observed $\bar{\nu}_e$ deficit

All Mixed Up

Neutrino mass and flavor eigenstates strongly mixed!

Measured Mixings:

$$\theta_{12} \approx 34^\circ, \theta_{23} \approx 40^\circ, \theta_{13} \approx 9^\circ$$

$$U_{\text{PMNS}} = \begin{pmatrix} 0.82 & 0.55 & 0.15 \\ -0.50 & 0.58 & 0.64 \\ 0.26 & -0.60 & 0.75 \end{pmatrix}$$

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = U \times \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

assuming $\delta_{CP} = 0$

Future Lessons from Neutrino Physics

Extra Flavor

Are there more than 3 neutrino states?

Existing anomalies may motivate sterile neutrinos:

Reactor:

Measured 5% deficit relative to reactor models.

Gallium:

Deficit in radioactive source experiments.

LSND:

Excess of $\bar{\nu}_e$ in $\bar{\nu}_\mu$ beam

MiniBooNE:

Excess of low energy $\nu_e, \bar{\nu}_e$.

Many Proposed Experiments

Table 7: Proposed sterile neutrino searches.

Experiment	ν Source	ν Type	Channel	Host	Cost Category ¹
CeLAND [259]	^{144}Ce - ^{144}Pr	$\bar{\nu}_e$	disapp.	Kamioka, Japan	small ²
	^{144}Ce - ^{144}Pr	$\bar{\nu}_e$	disapp.	China	small
	^{51}Cr	ν_e	disapp.	LNGS, Italy	small ²
	^{144}Ce - ^{144}Pr	$\bar{\nu}_e$	disapp.	Russia	small
BEST [64]	^{51}Cr	ν_e	disapp.	Russia	small
PROSPECT [262]	Reactor	$\bar{\nu}_e$	disapp.	US ³	small
STEREO	Reactor	$\bar{\nu}_e$	disapp.	ILL, France	N/A ⁴
DANSS [263]	Reactor	$\bar{\nu}_e$	disapp.	Russia	N/A ⁴
OscSNS [205]	π -DAR	$\bar{\nu}_\mu$	$\bar{\nu}_e$ app.	ORNL, U.S.	medium
LAr1 [264]	π -DIF	$(\bar{\nu}_\mu)$	$(\bar{\nu}_e)$ app.	Fermilab	medium
LAr1-ND [264]	π -DIF	$(\bar{\nu}_\mu)$	$(\bar{\nu}_e)$ app.	Fermilab	medium
MiniBooNE+ [203]	π -DIF	$(\bar{\nu}_\mu)$	$(\bar{\nu}_e)$ app.	Fermilab	small
MiniBooNE II [265]	π -DIF	$(\bar{\nu}_\mu)$	$(\bar{\nu}_e)$ app.	Fermilab	medium
ICARUS/NESSiE [266]	π -DIF	$(\bar{\nu}_\mu)$	$(\bar{\nu}_e)$ app.	CERN	N/A ⁴
IsoDAR [111]	^8Li -DAR	$\bar{\nu}_e$	disapp.	Kamioka, Japan	medium
nuSTORM [192]	μ Storage Ring	$(\bar{\nu}_e)$	$(\bar{\nu}_\mu)$ app.	Fermilab/CERN	large

¹ Rough recost categories: small: <\$5M, medium: \$5M-\$50M, large: \$50M-\$300M.

² U.S. scope only.

³ Multiple sites are under consideration [267].

⁴ No U.S. participation proposed.

arXiv:1310.4340

Reactor Anomaly

Daya Bay will constrain some sterile models

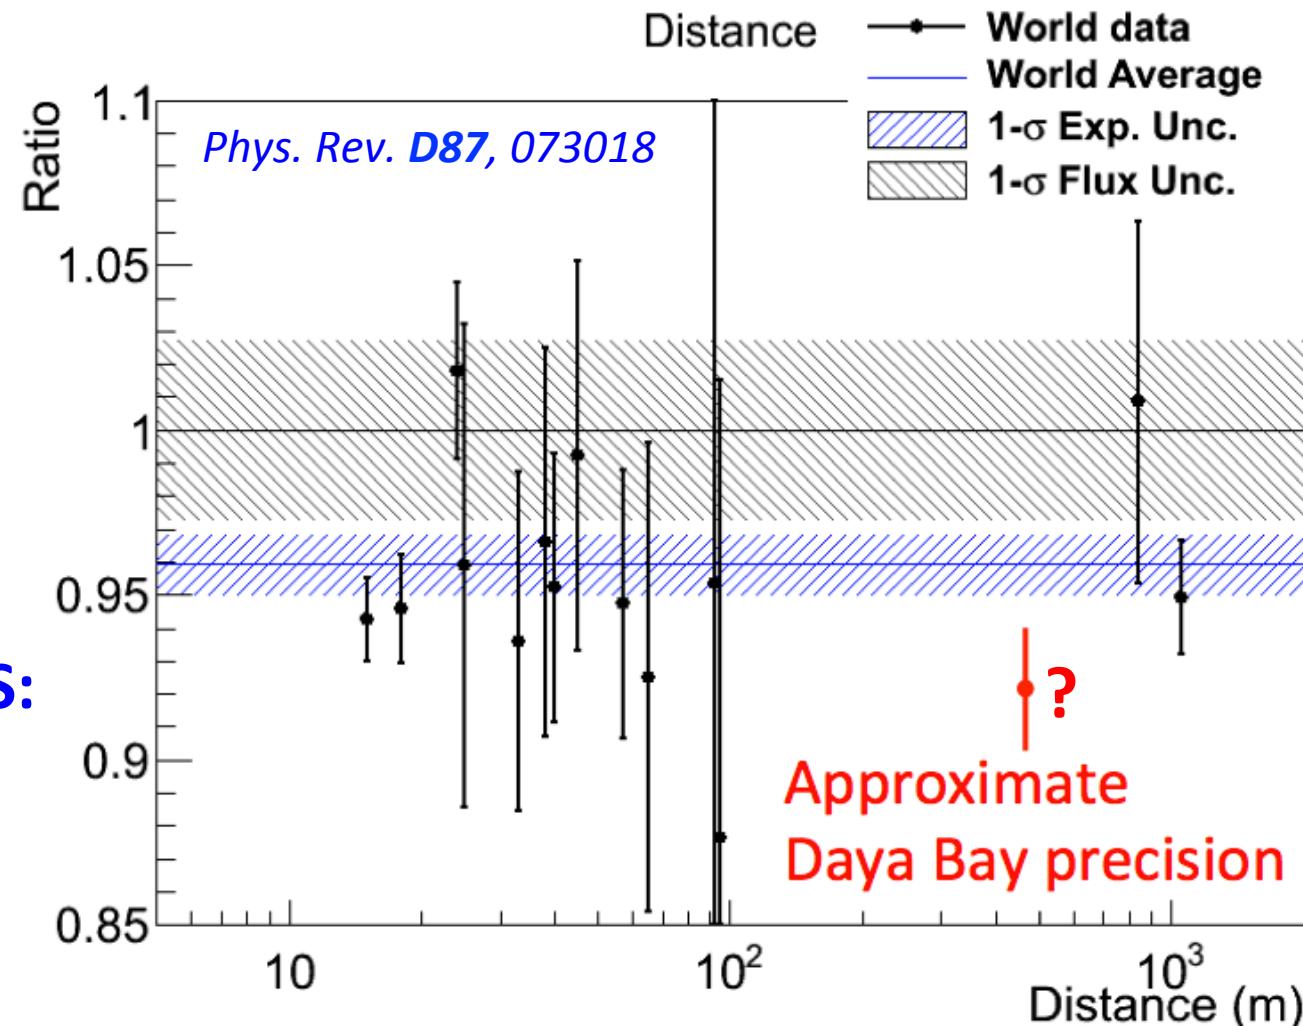

Daya Bay:

Will provide precise total reactor flux at ~ 400 m.

Comparison of near and far spectra will limit sterile mixing at percent level.

PROSPECT, STEREO, DANSS:

Dedicated new experiments to test at ~ 10 m distance.

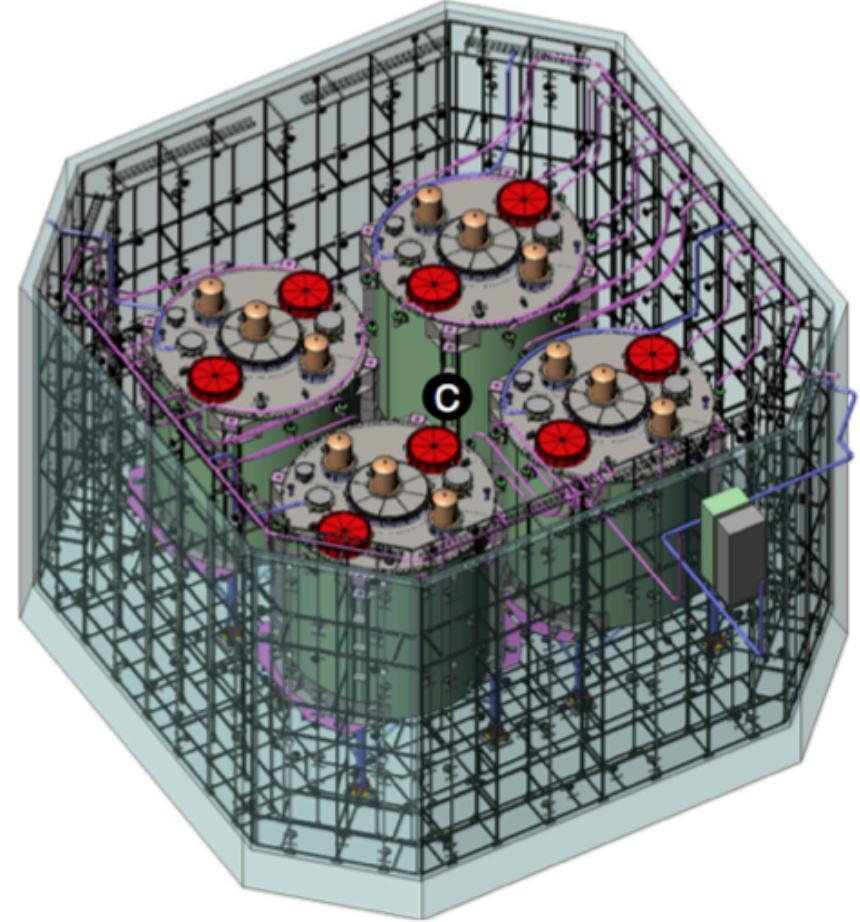

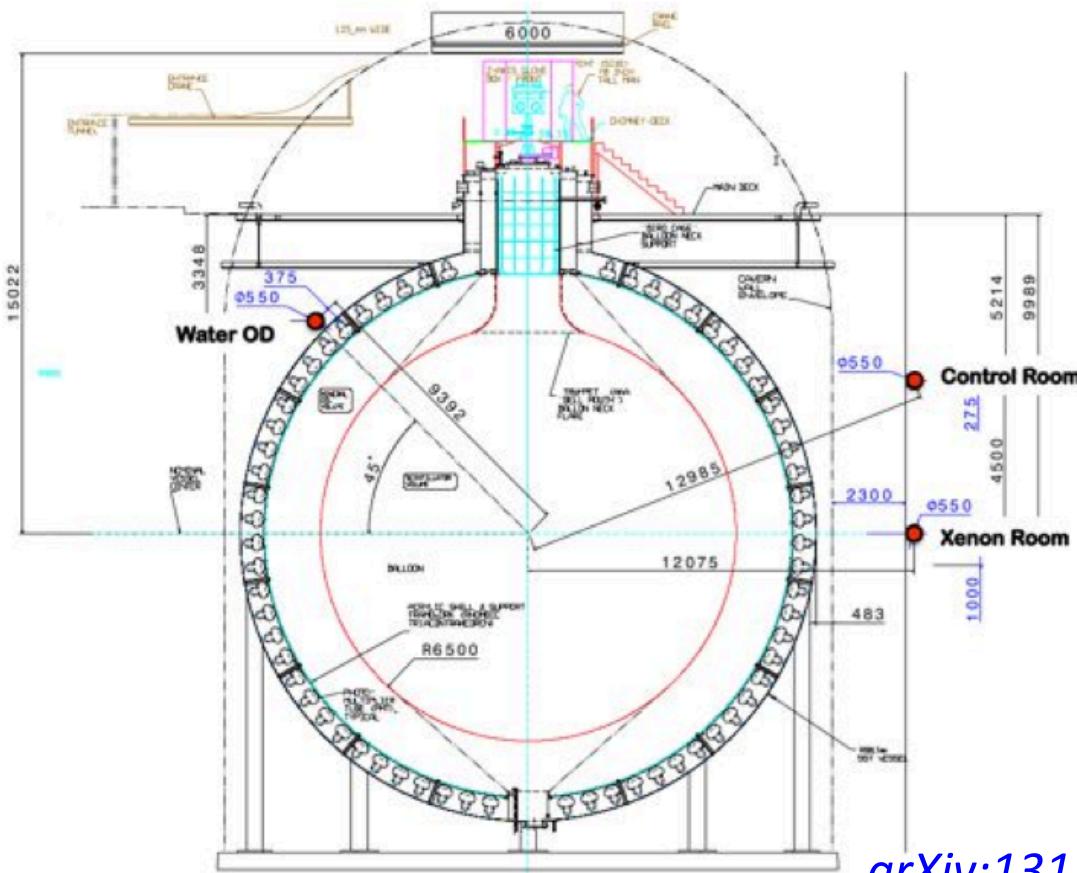

Antineutrino Source

A compact $\bar{\nu}_e$ source is ideal for testing reactor anomaly

Intense ^{144}Ce radioactive source

Phys. Rev. Lett. 107, 201801 (2011)

Probe 1 eV² mass splittings (~1 m distance)

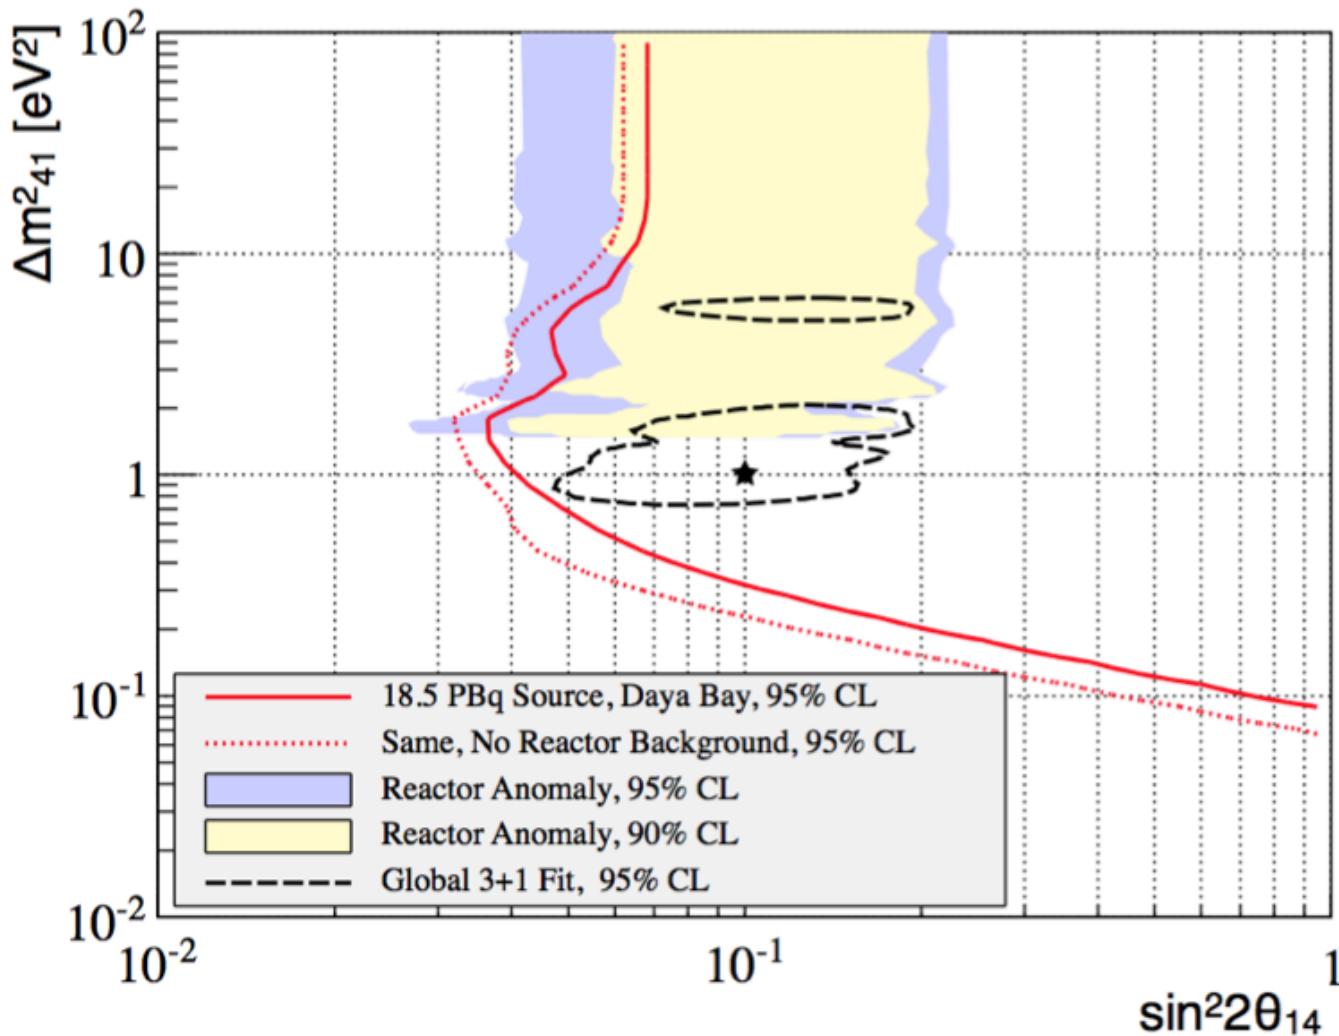

Explored measurement using Daya Bay facility

Phys. Rev. D87, 093002 (2013)

Experiment Reach

Known detectors allow reliable exclusion of sterile models

Advantages:

- Well-understood detectors
- Clear signal
- Low-background

Concerns:

- Backgrounds from ¹⁴⁴Ce source
- Source manufacture
- Source transport

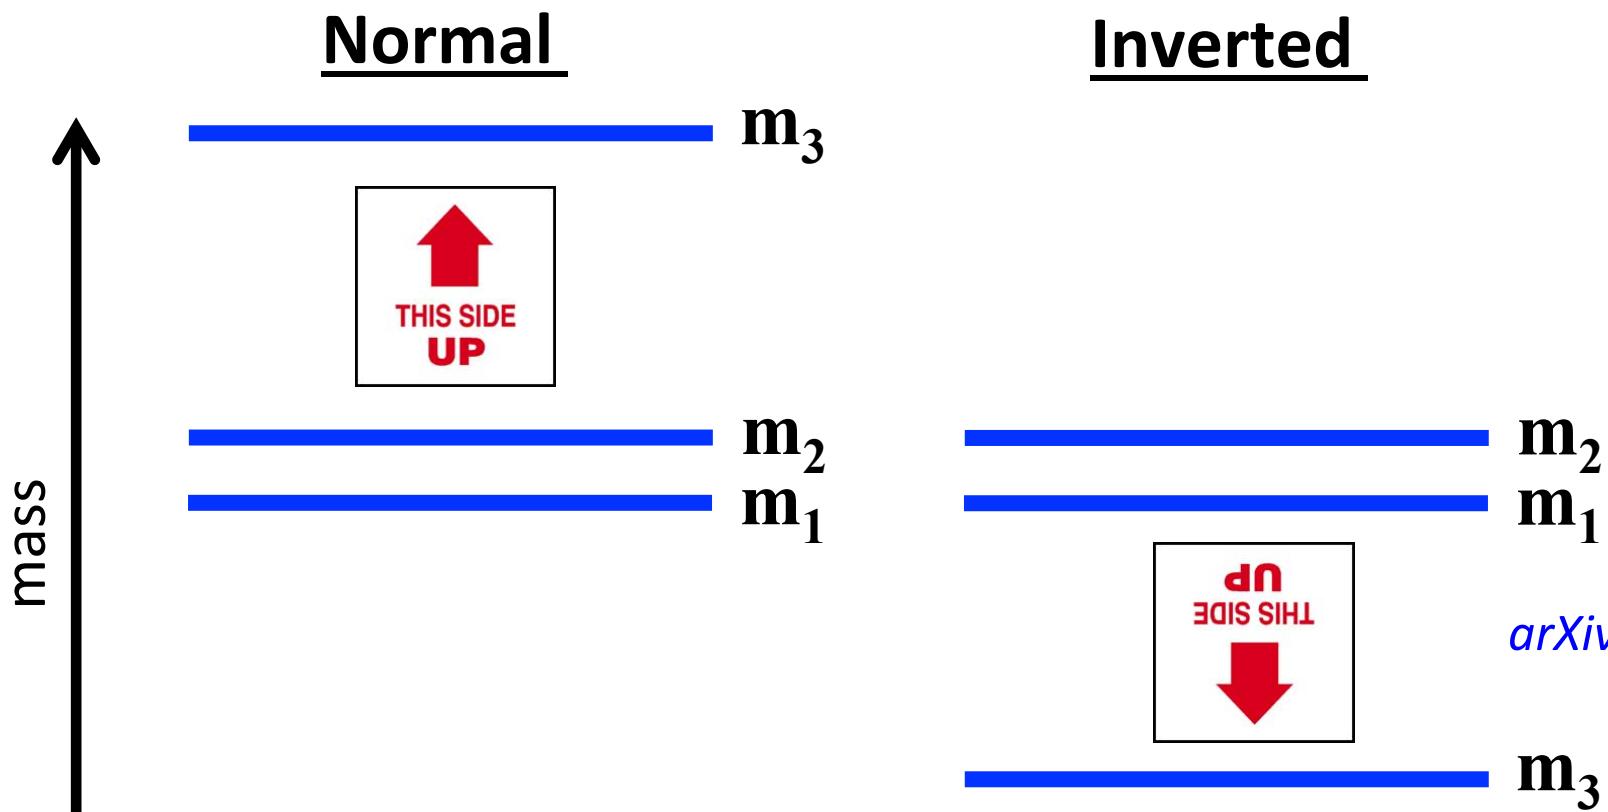

Neutrino Mass Hierarchy

What is the ordering of the three ν mass eigenstates?

KamLAND
 $|\Delta m_{21}^2| \approx 7.5 \times 10^{-5} \text{ eV}^2$

Solar ν
 $|\Delta m_{21}^2| > 0$

MINOS, Daya Bay
 $|\Delta m_{3x}^2| \approx 2.5 \times 10^{-3} \text{ eV}^2$

arXiv:1307.5487

Large θ_{13} produces many experimental signs of the mass hierarchy.

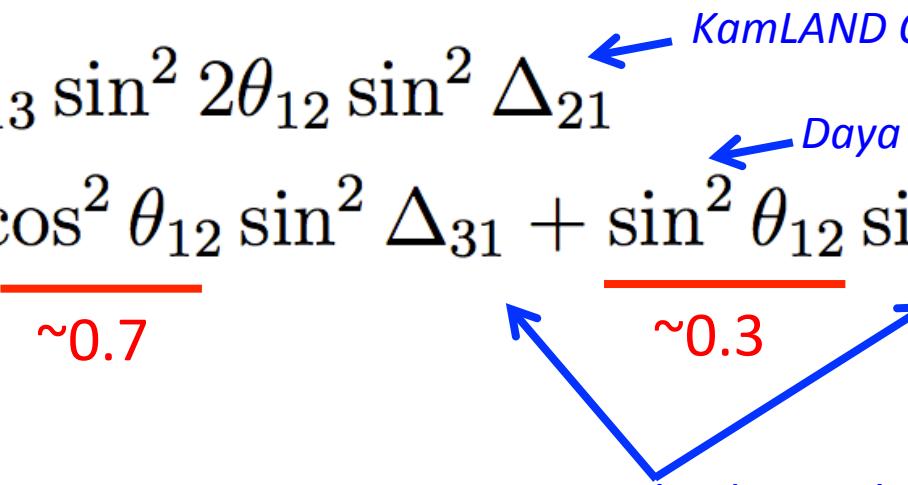

Reactor $\bar{\nu}_e$ Disappearance

Three frequencies, but which is which?

$$P_{\bar{\nu}_e \rightarrow \bar{\nu}_e} = 1 - \cos^4 \theta_{13} \sin^2 2\theta_{12} \sin^2 \Delta_{21}$$

$\overbrace{- \sin^2 2\theta_{13} (\cos^2 \theta_{12} \sin^2 \Delta_{31} + \sin^2 \theta_{12} \sin^2 \Delta_{32})}$

~ 0.7

KamLAND Oscillation (~100 km)

Daya Bay Oscillation (~km)

Two nearly identical oscillation frequencies

For both hierarchies:

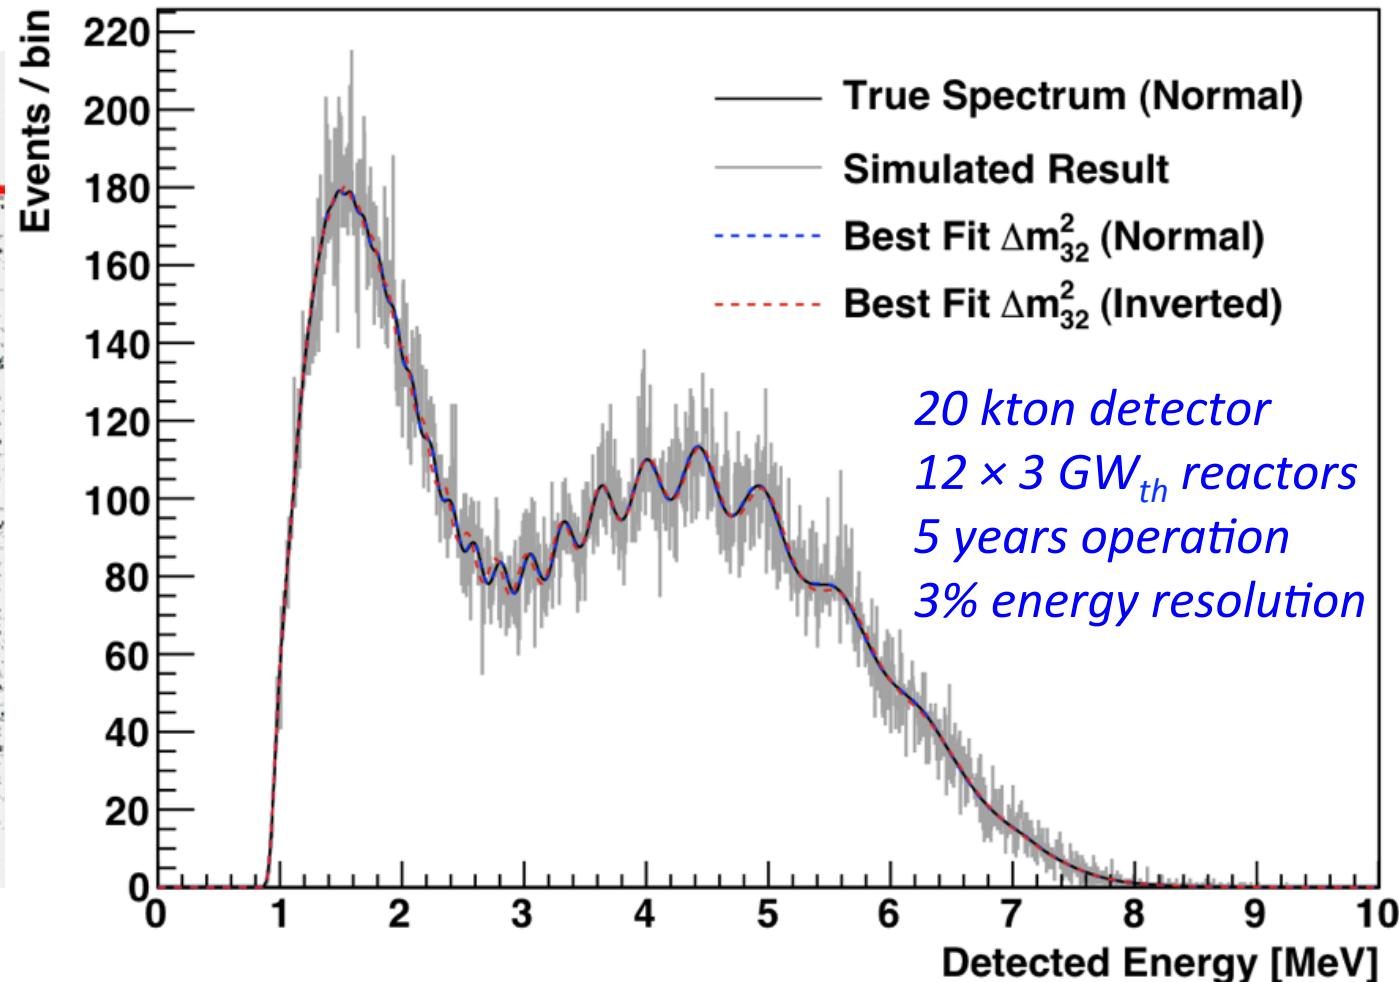

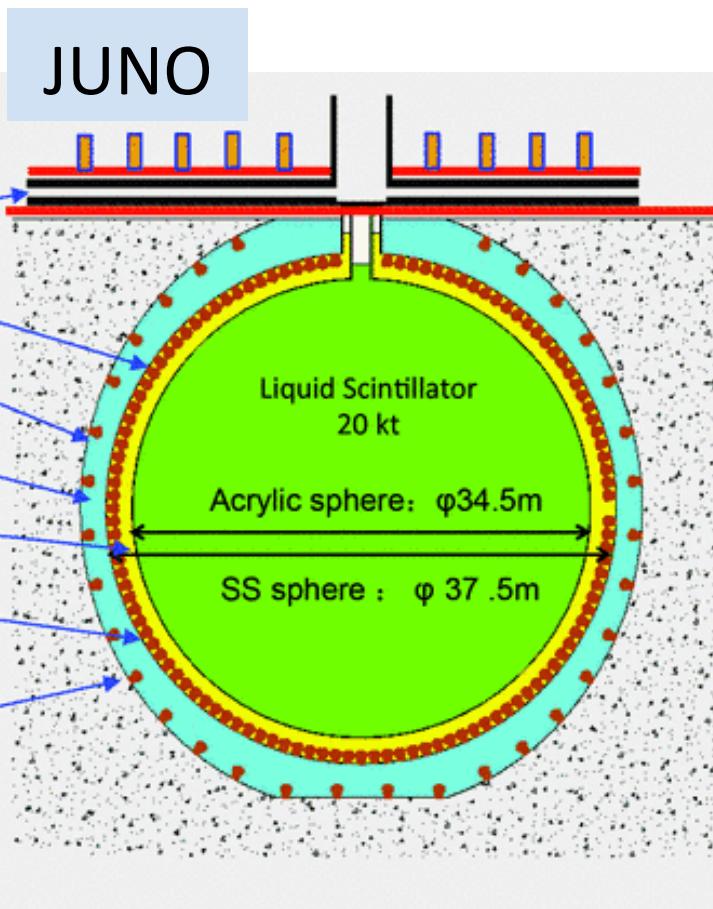

$|\Delta_{32} - \Delta_{31}| = |\Delta_{21}| \rightarrow$ Frequency difference gives no hierarchy information

But **amplitudes** are different:

Normal Hierarchy:	$ \Delta_{31} > \Delta_{32} $	\rightarrow Larger amplitude at higher frequency
Inverted Hierarchy:	$ \Delta_{31} < \Delta_{32} $	\rightarrow Larger amplitude at lower frequency

Hierarchy: Reactor $\bar{\nu}_e$

Use large scintillator detector at ~ 60 km from reactors

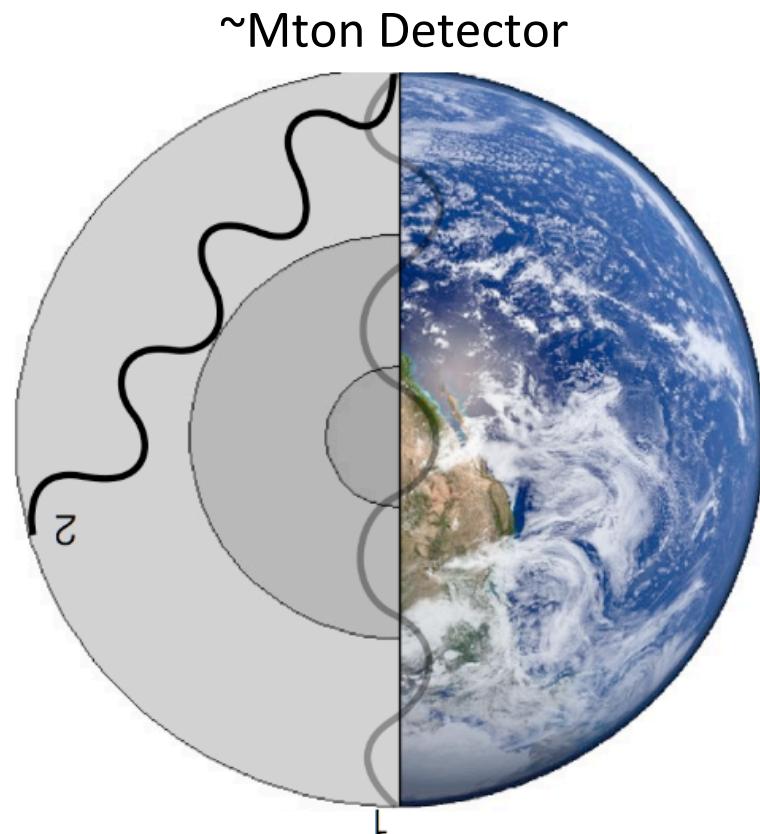

Achieving detector of sufficient resolution and calibration requires new technology.

Hierarchy: Atmospheric ν

Matter-enhanced oscillation can reveal sign of $|\Delta m_{3x}^2|$

Atmospheric neutrinos pass through earth matter to reach detector.

In Vacuum:

Oscillation probability constant for neutrinos with same proper time $\tau \approx L/E_\nu$

In Matter:

If resonance occurs, oscillation probability not constant for neutrinos with same τ .

Mass Hierarchy:

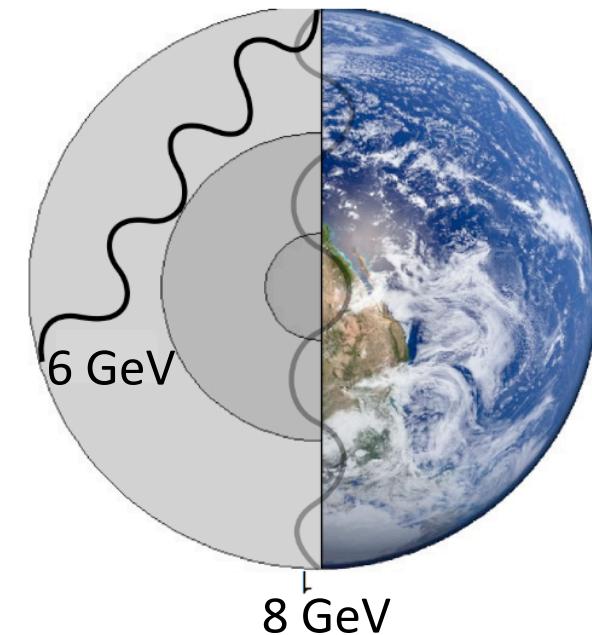

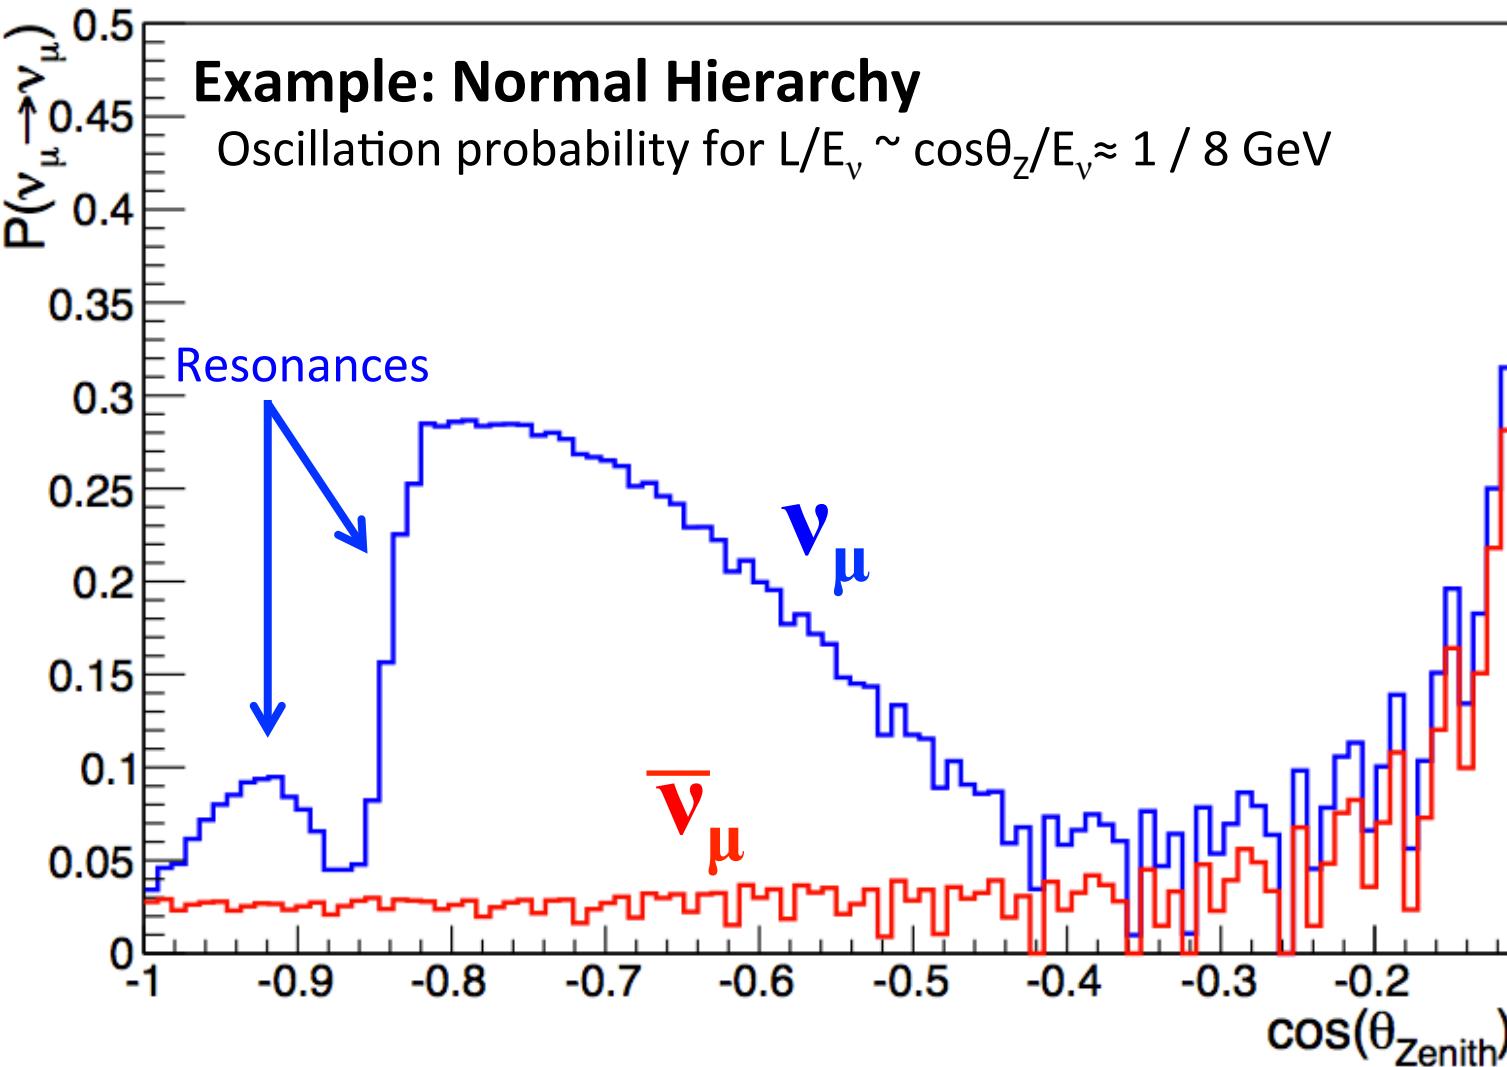

Resonance only occurs for neutrinos (Normal), or antineutrinos (Inverted).

Select neutrinos with similar proper time:

$$\tau \approx L/E_\nu \approx \cos\theta_z/E_\nu$$

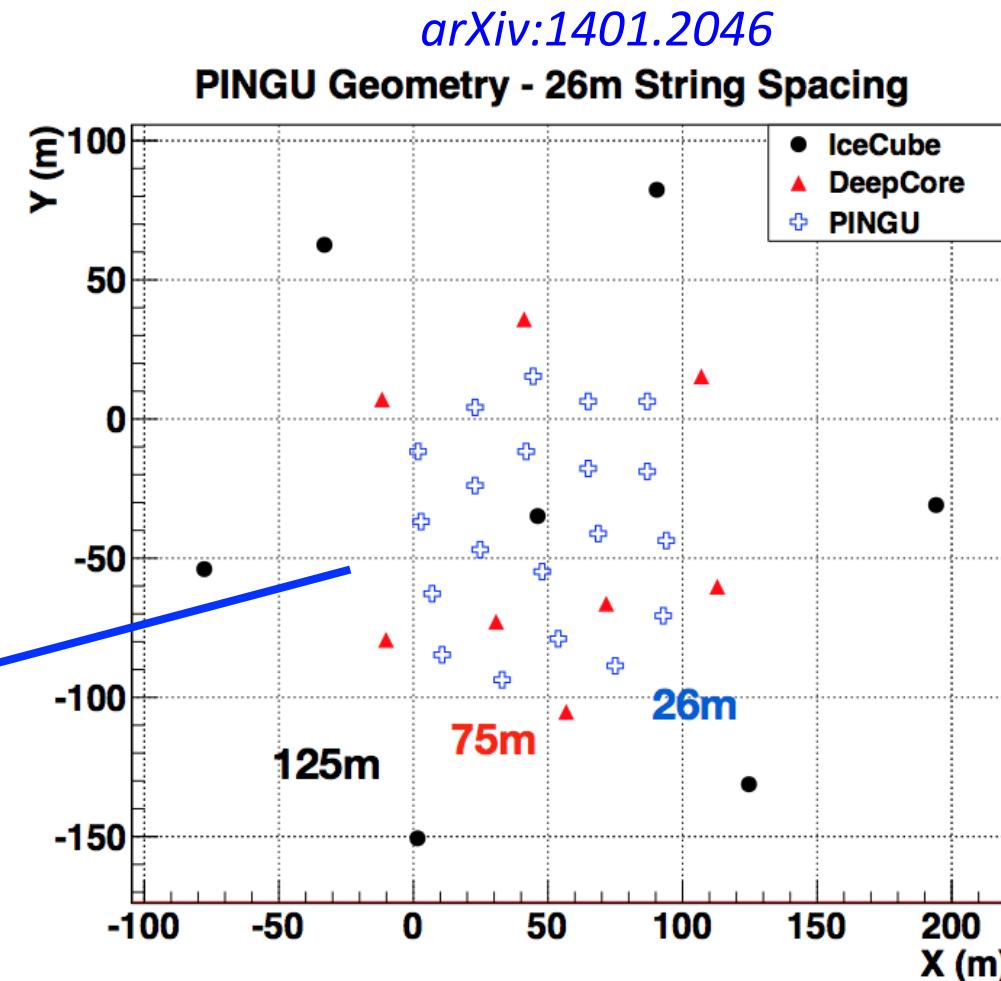

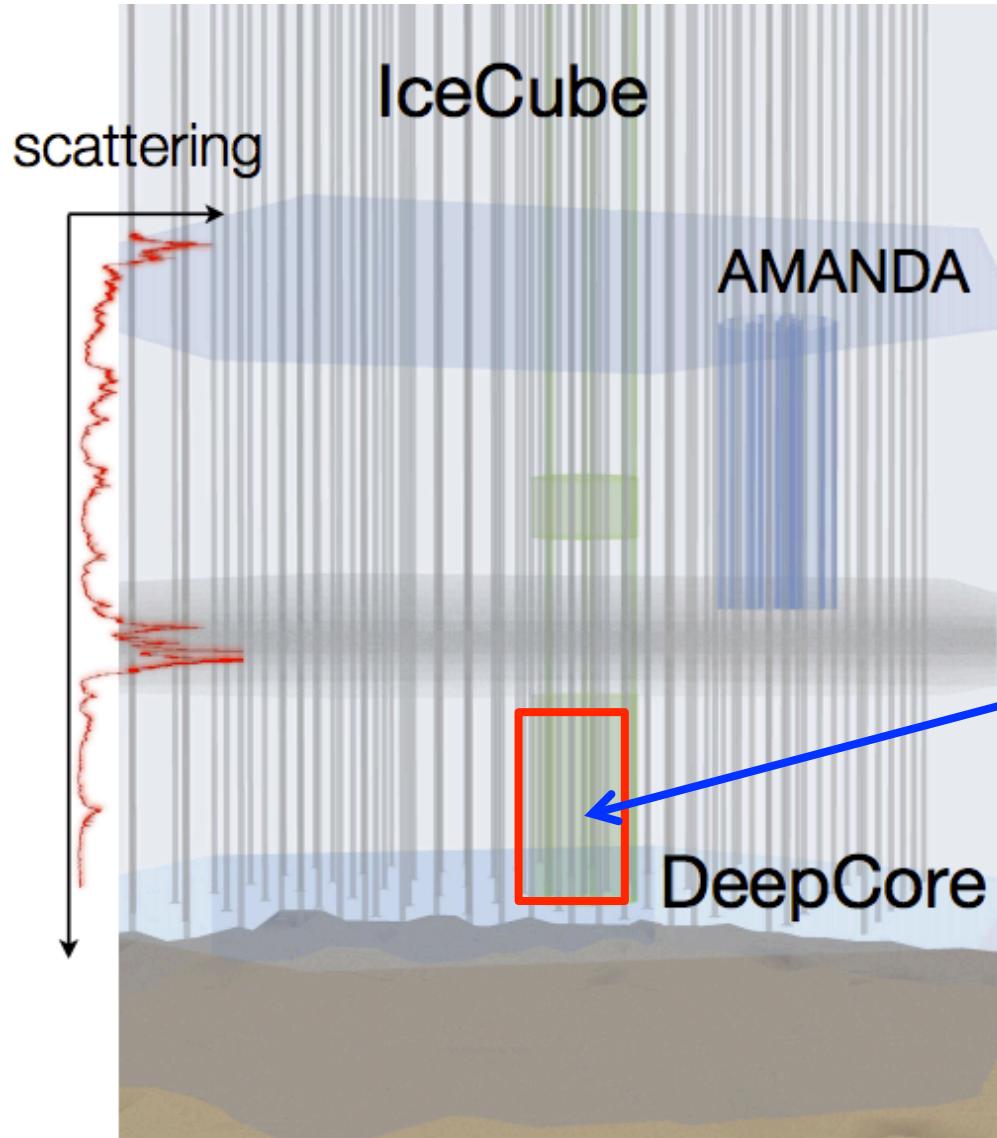

Hierarchy: Atmospheric ν

Matter-enhanced oscillation can reveal sign of $|\Delta m_{3x}^2|$

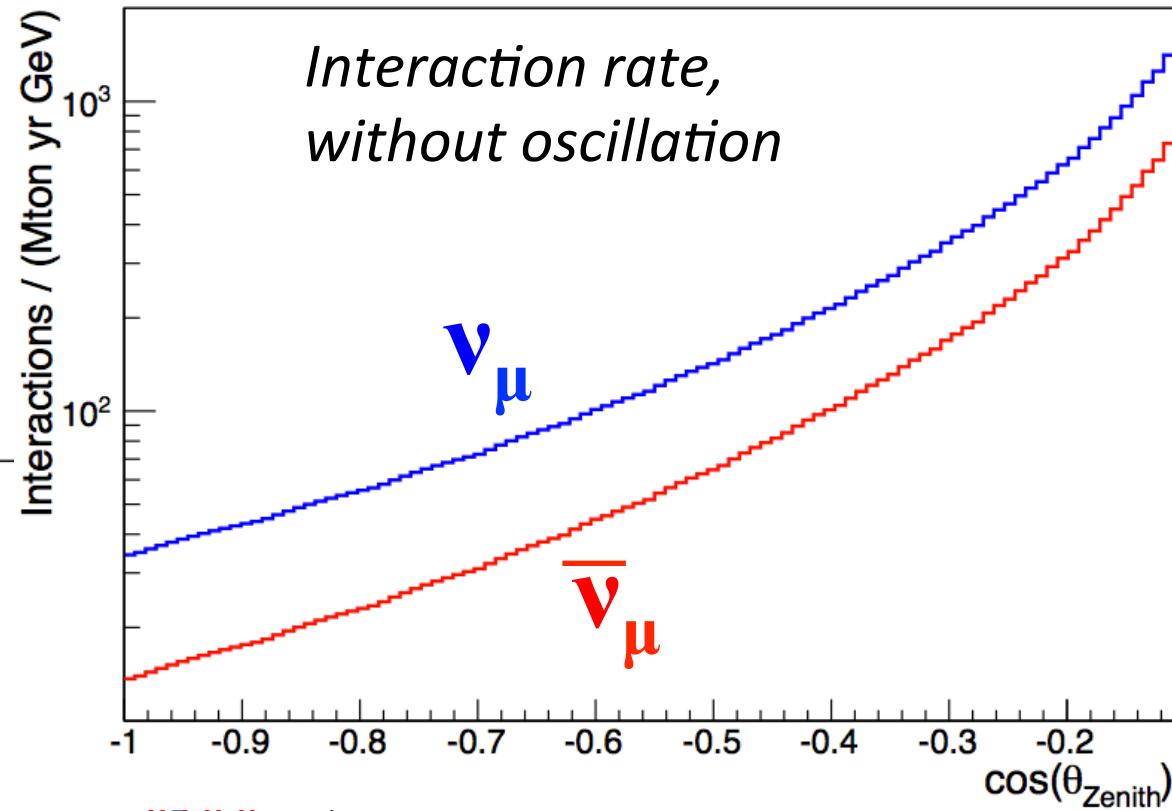

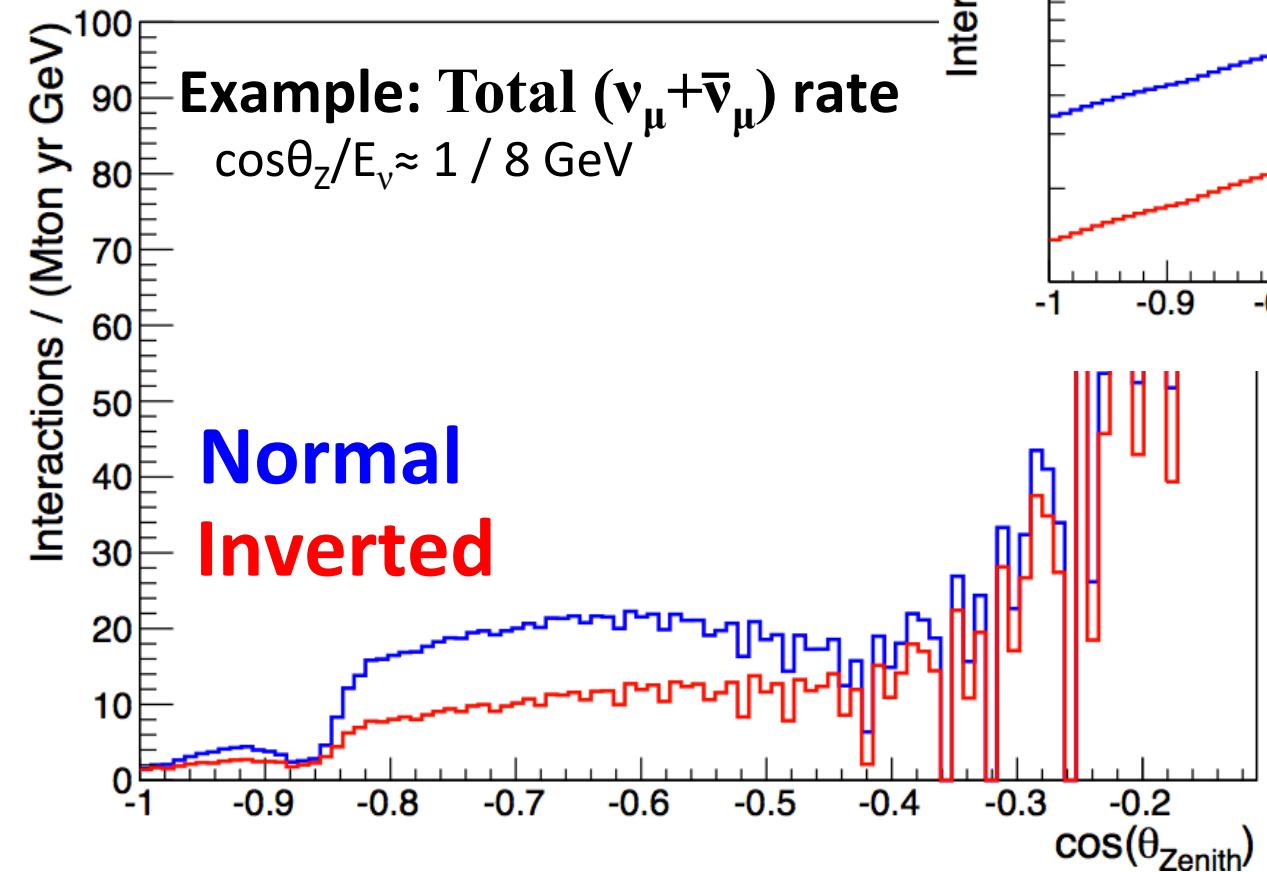

Hierarchy: Atmospheric ν

PINGU: Denser instrumentation at center of IceCube

Hierarchy: Atmospheric ν

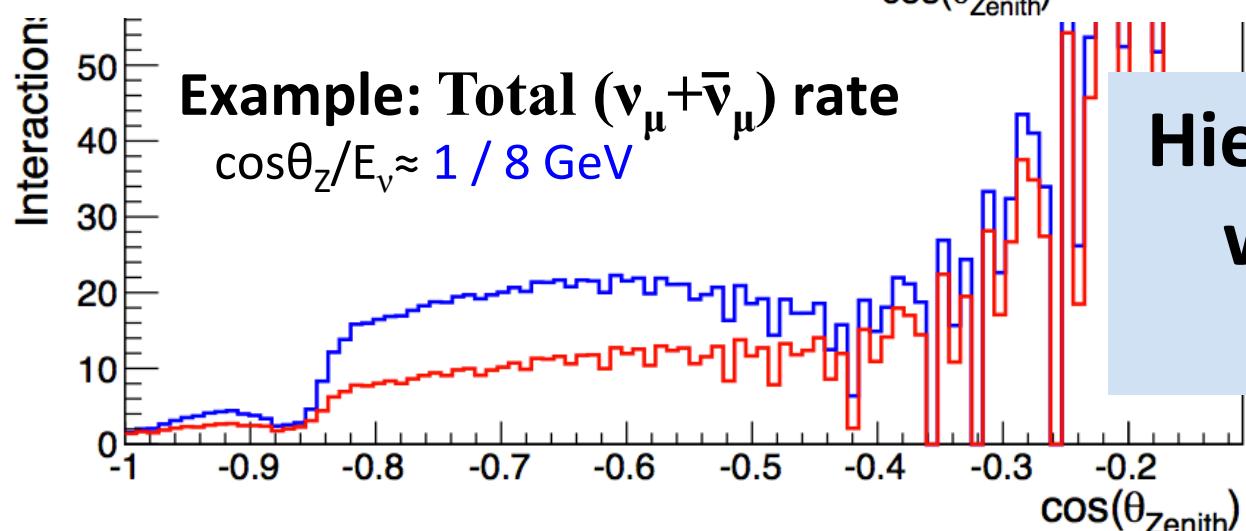

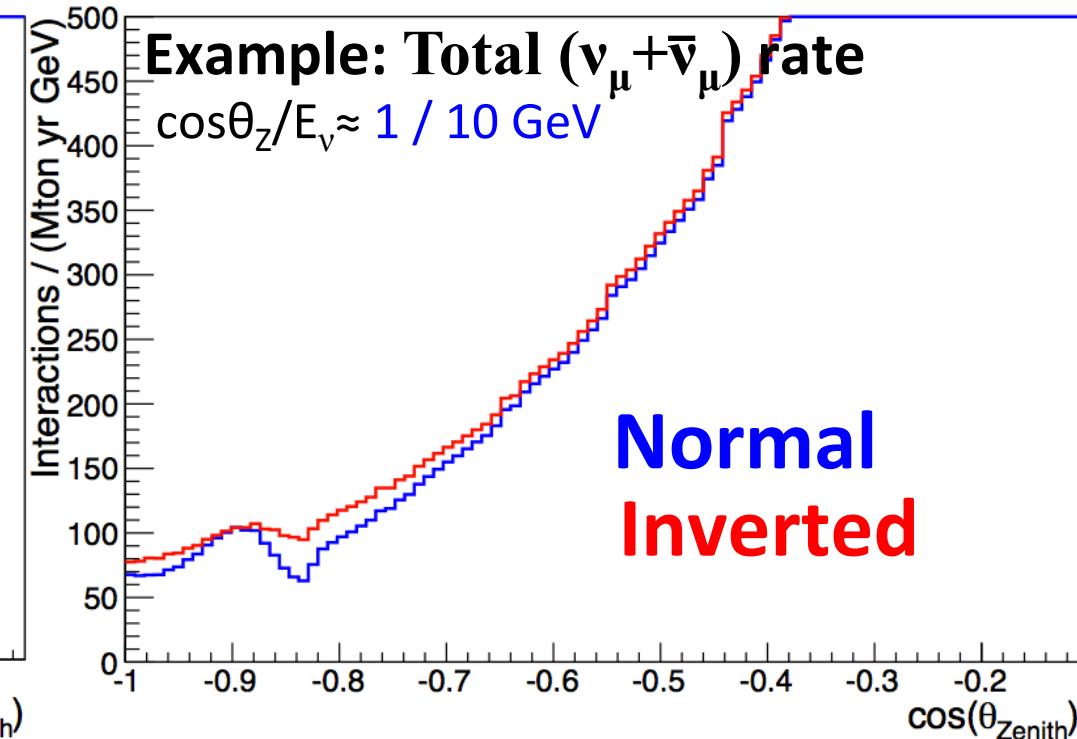

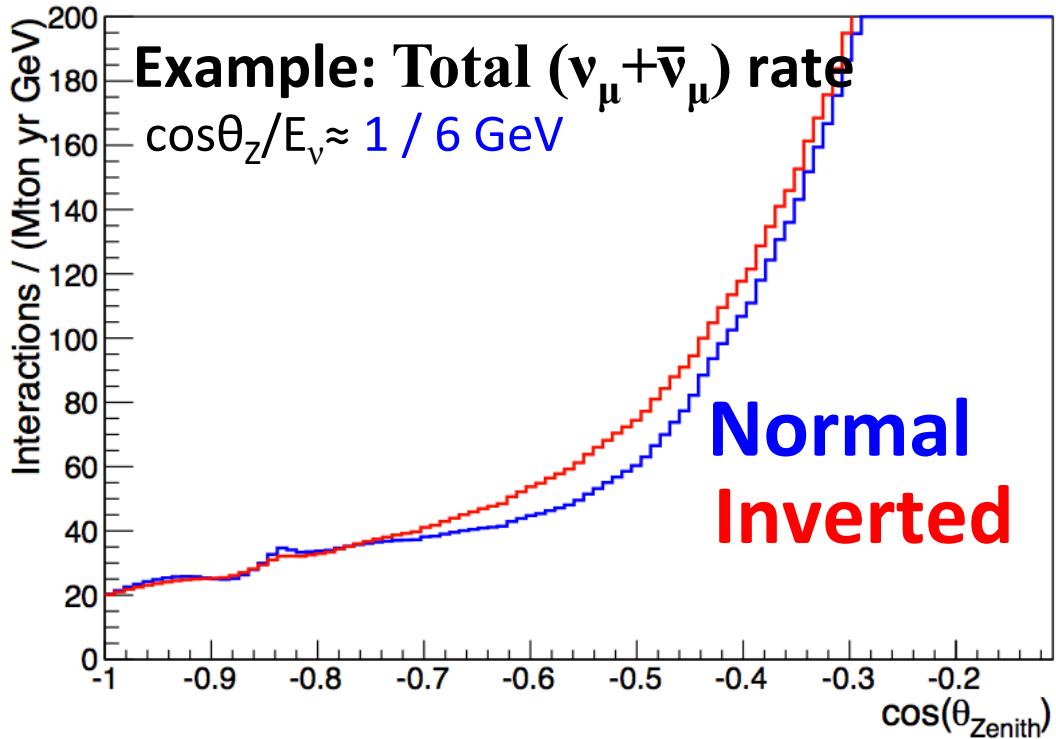

Nature provides excess neutrinos vs. antineutrinos

If unable to discriminate ν from $\bar{\nu}$, can still observe change in combined rate.

Detector Performance

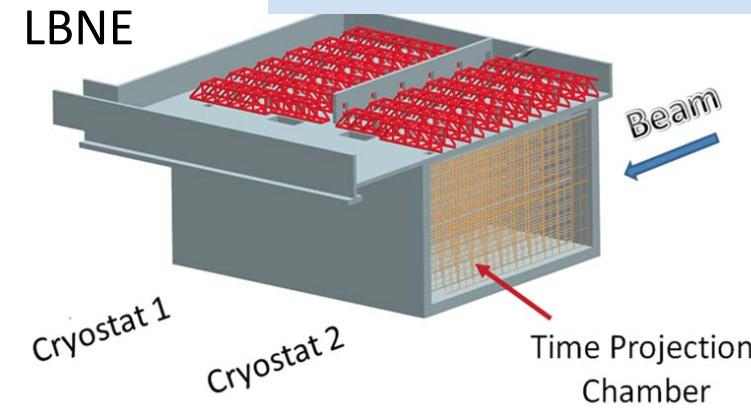

Detector energy and angular resolution critical.

Hierarchy resonance easily washed-out if detector resolution is poor

Other Big Questions

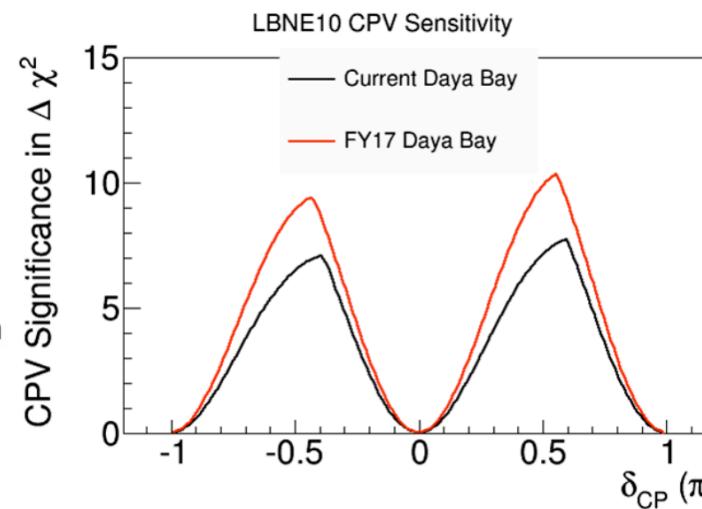

Do neutrinos violate Charge-Parity symmetry?

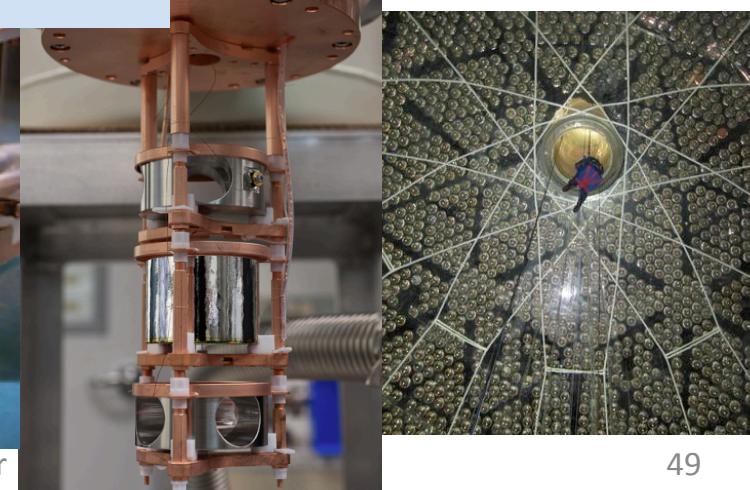

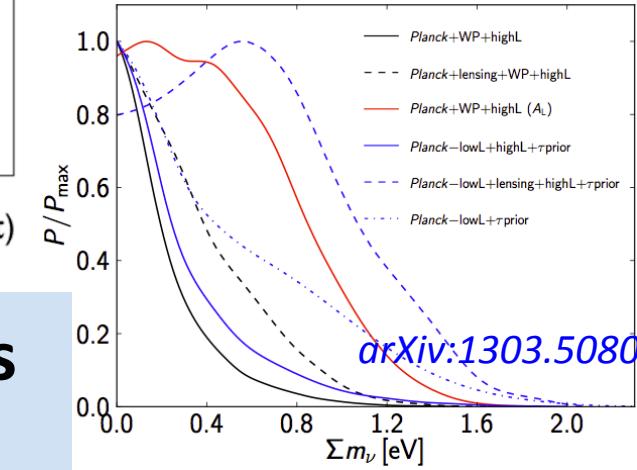

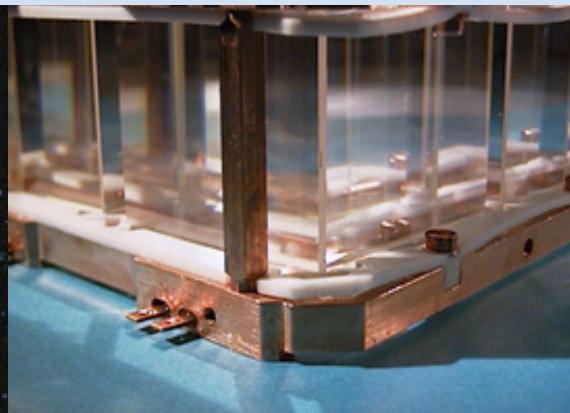

Can neutrinos explain matter-antimatter asymmetry?

What is the absolute neutrino mass?

Is the neutrino mass Dirac or Majorana?

Dark Matter

Strong interplay between ν and WIMP physics

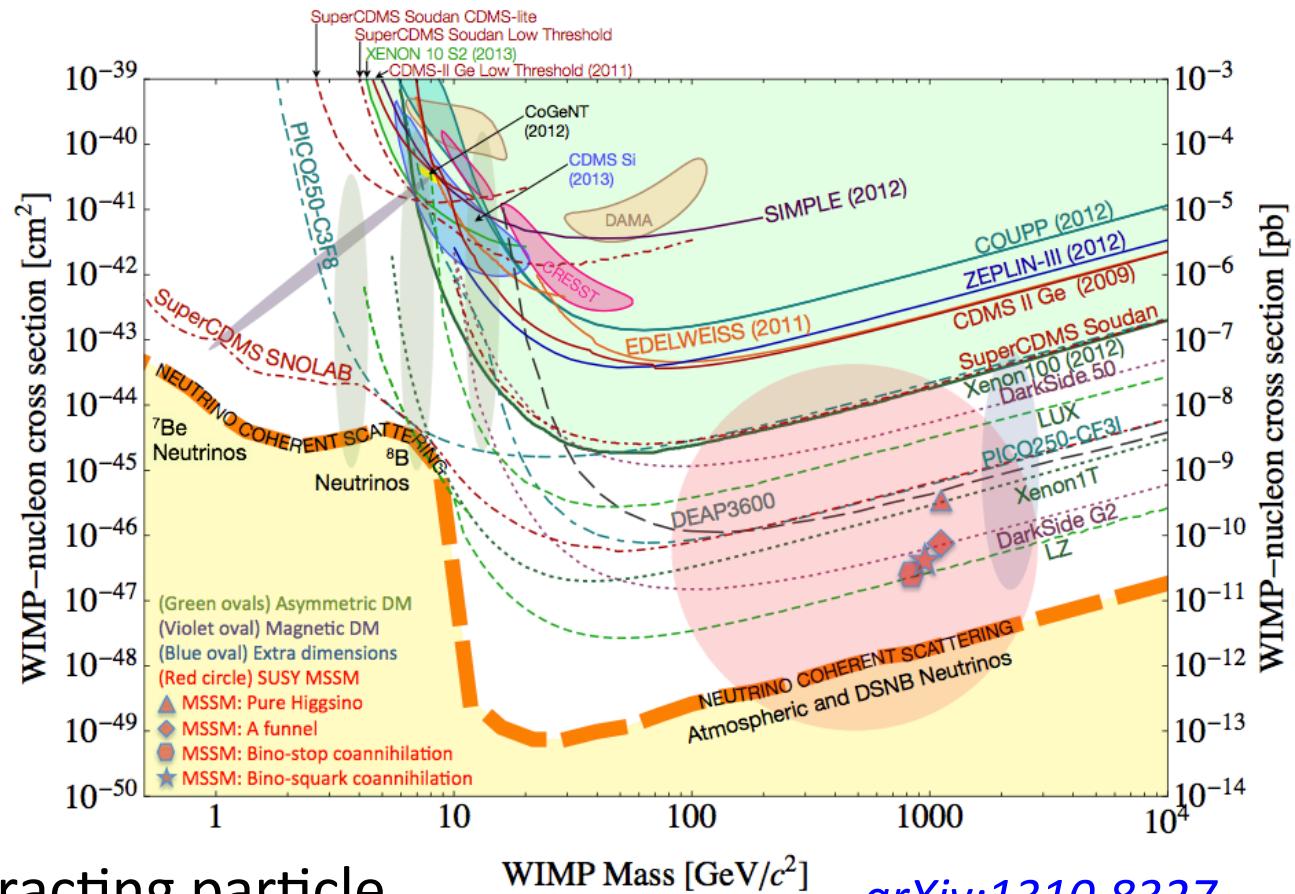

Experiment:

Large detectors

Low-energy physics (< MeV)

Low-radioactivity materials

Continuous operation

[arXiv:1310.8327](https://arxiv.org/abs/1310.8327)

Theory:

Neutrino: Light weakly-interacting particle

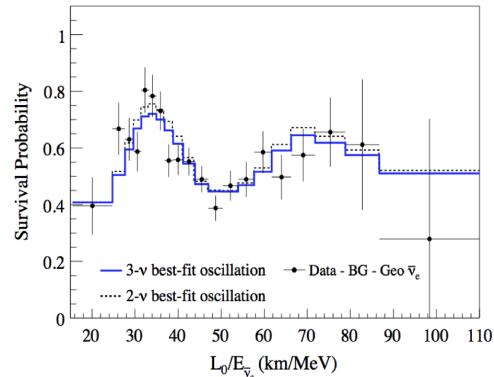

WIMP: Heavy weakly-interacting particle

If WIMPs exist, do they have a fundamental relationship with the neutrino?

Closing

Many lessons from neutrinos so far.

Neutrinos oscillate and have mass

Neutrinos all mixed up

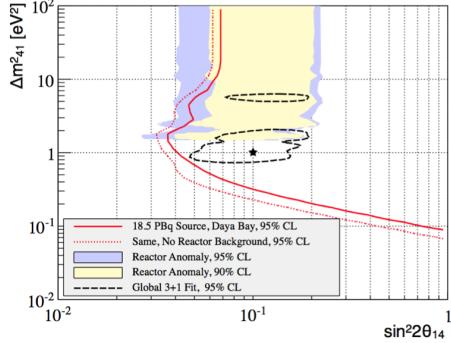

$$U_{\text{PMNS}} = \begin{pmatrix} 0.82 & 0.55 & 0.15 \\ -0.50 & 0.58 & 0.64 \\ 0.26 & -0.60 & 0.75 \end{pmatrix}$$

Farm-to-Table Physics

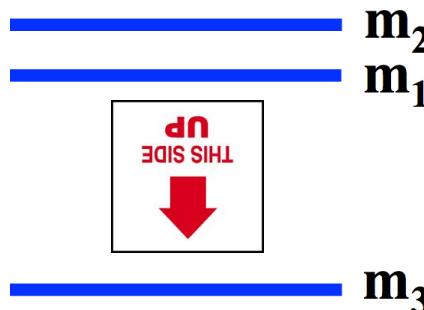

Surely more lessons to come.

Neutrino Flavors?

Neutrino Mass
